The proton is just 2 up quarks and 1 down quark, ...

What *is* a proton, neutron, nucleus?

QCD - *been there, done that, got the T-shirt ?!*

What *is* a proton, neutron, nucleus?

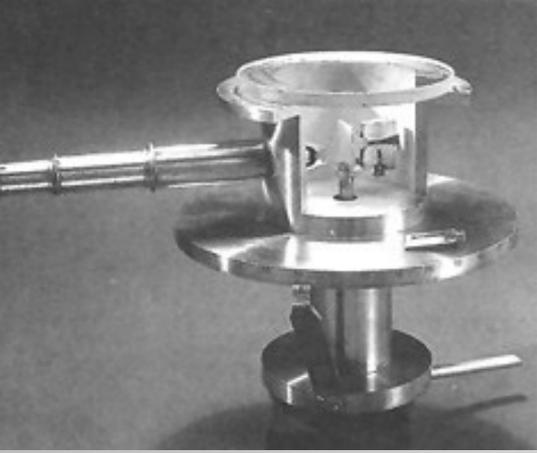

A strongly-bound object of $\sim 0.8\text{fm}$ radius,
 $\sim 0.94\text{ GeV}$ mass
spin $1/2$

None of these are Standard Model parameters,

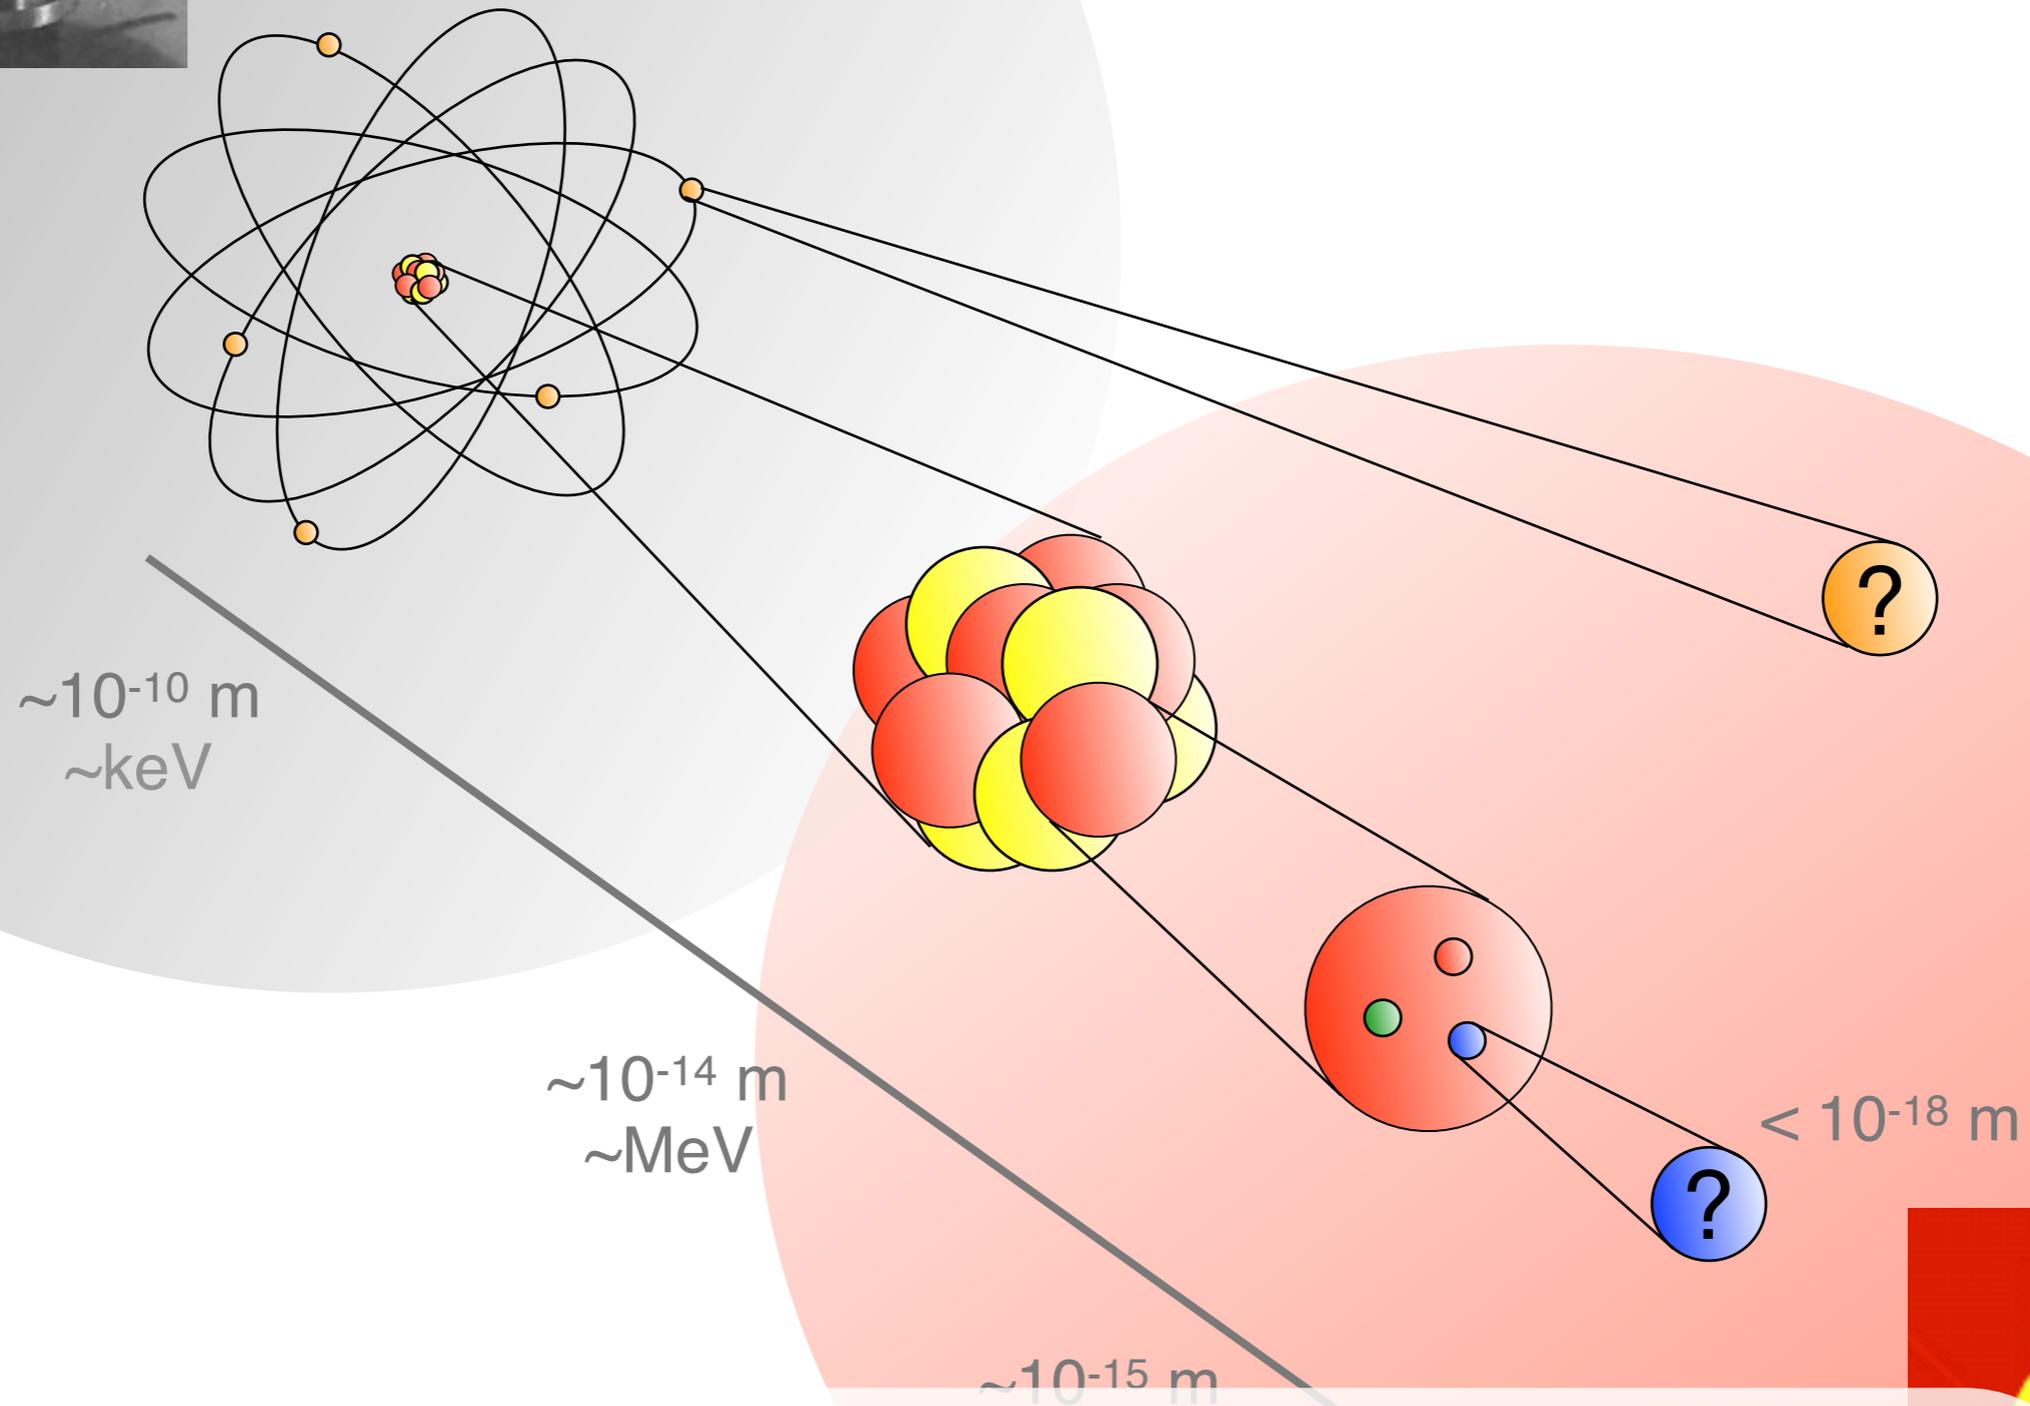

Ab-initio calculations are starting to scratch the surface,

To provoke a little: we are still *far* from “QCD-engineering,”

“QED-engineering” brought us the transistor.

What *is* a proton, neutron, nucleus?

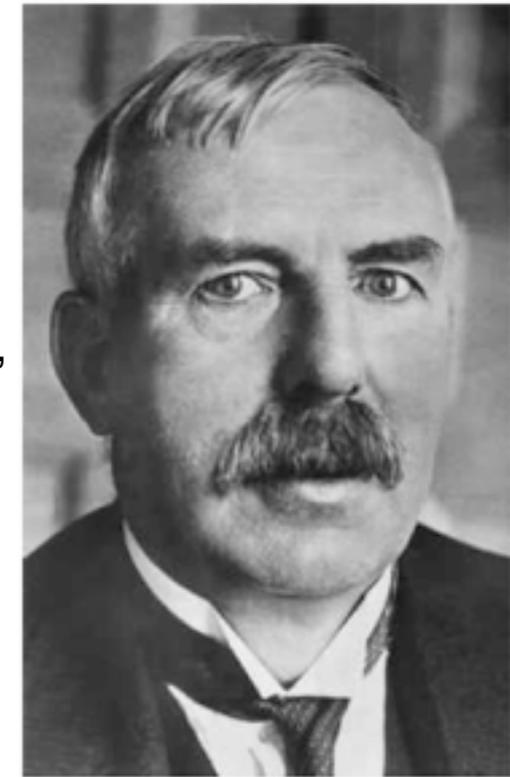

Strongly bound objects with rich structure and dynamics;
partially understood thanks to *decades* of
interplay between theory and *experiment*

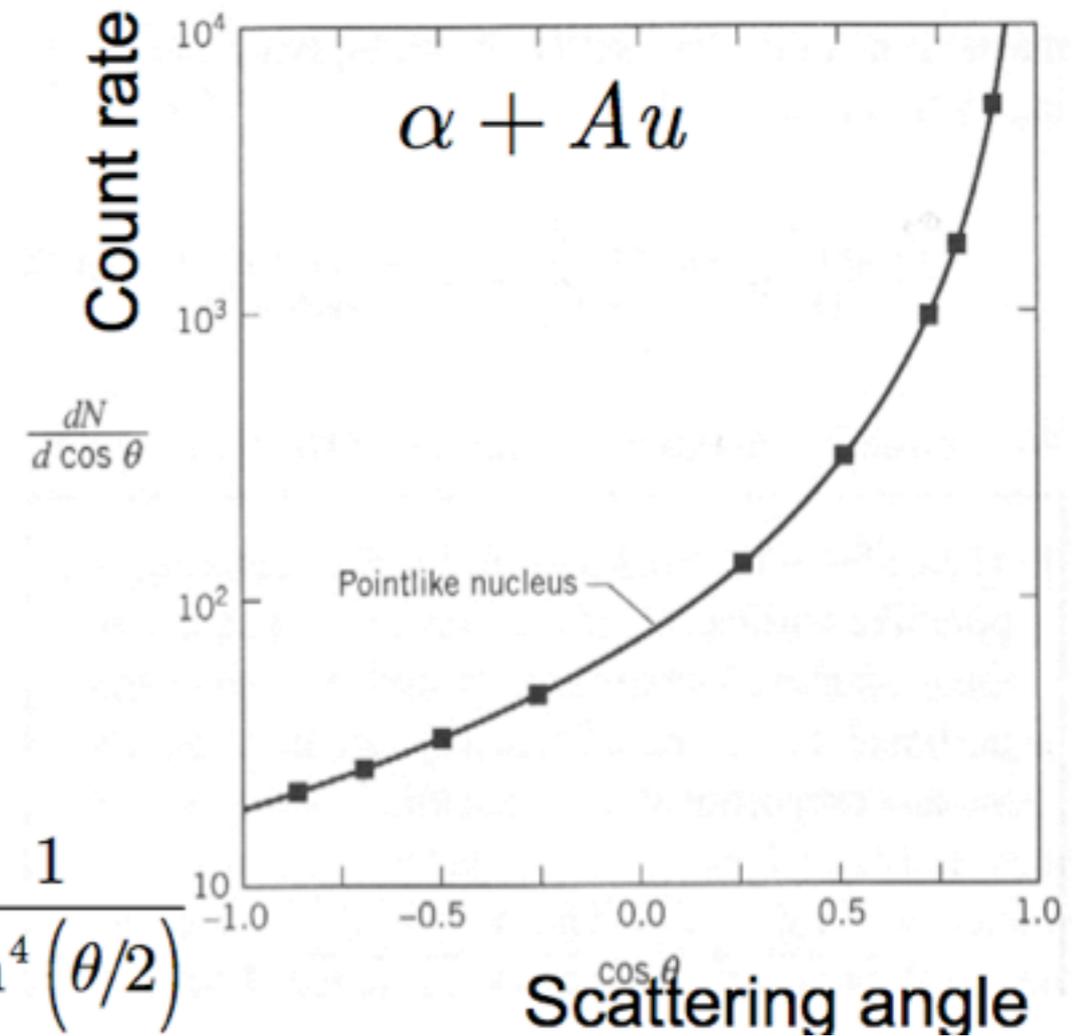

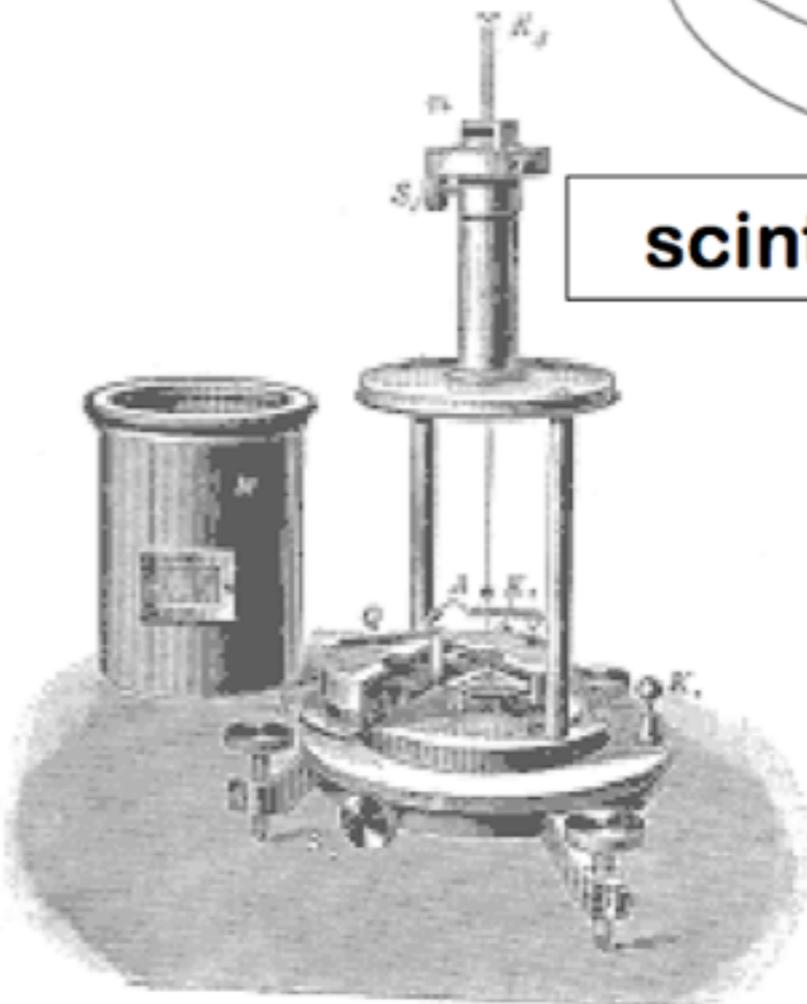

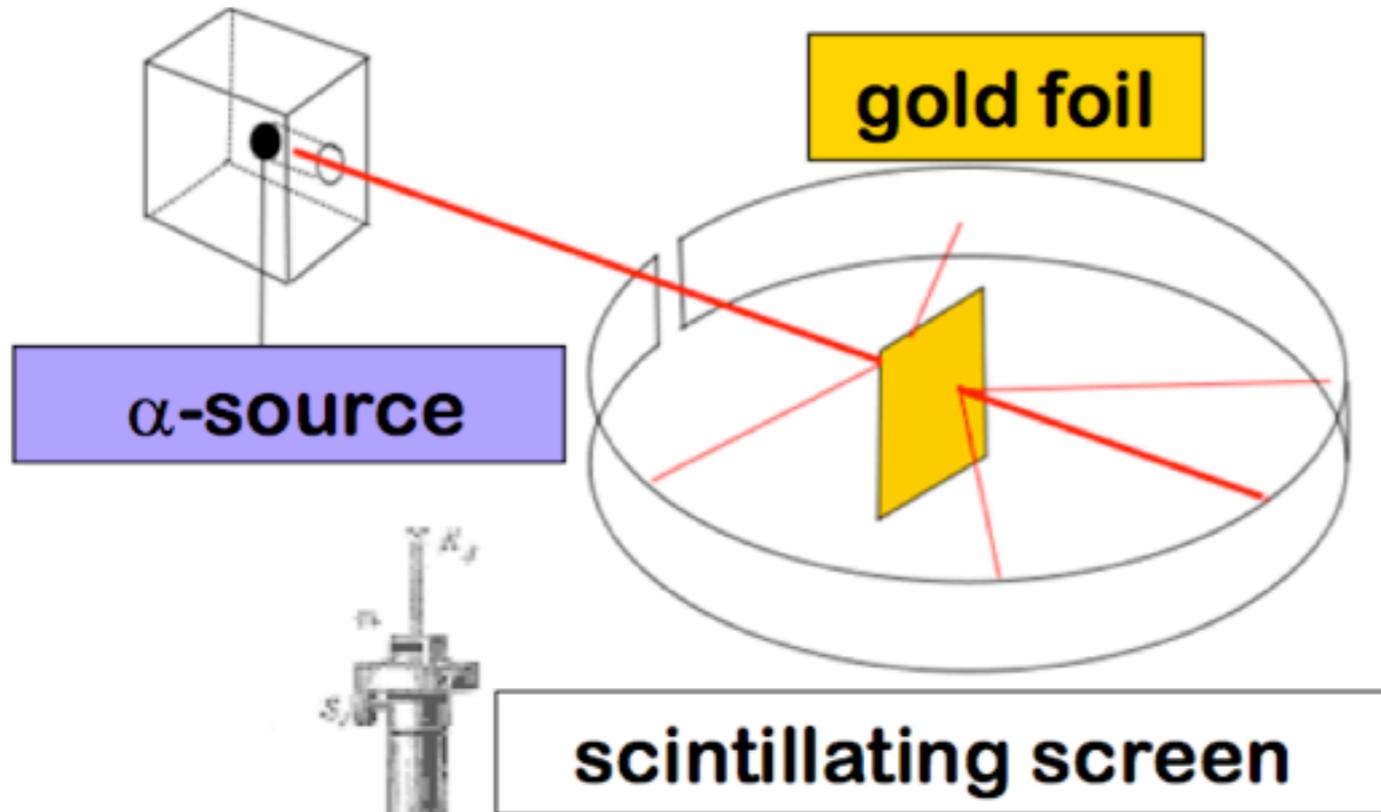

~5 MeV

Rutherford Scattering

Ernest Rutherford,
Nobel Prize 1908

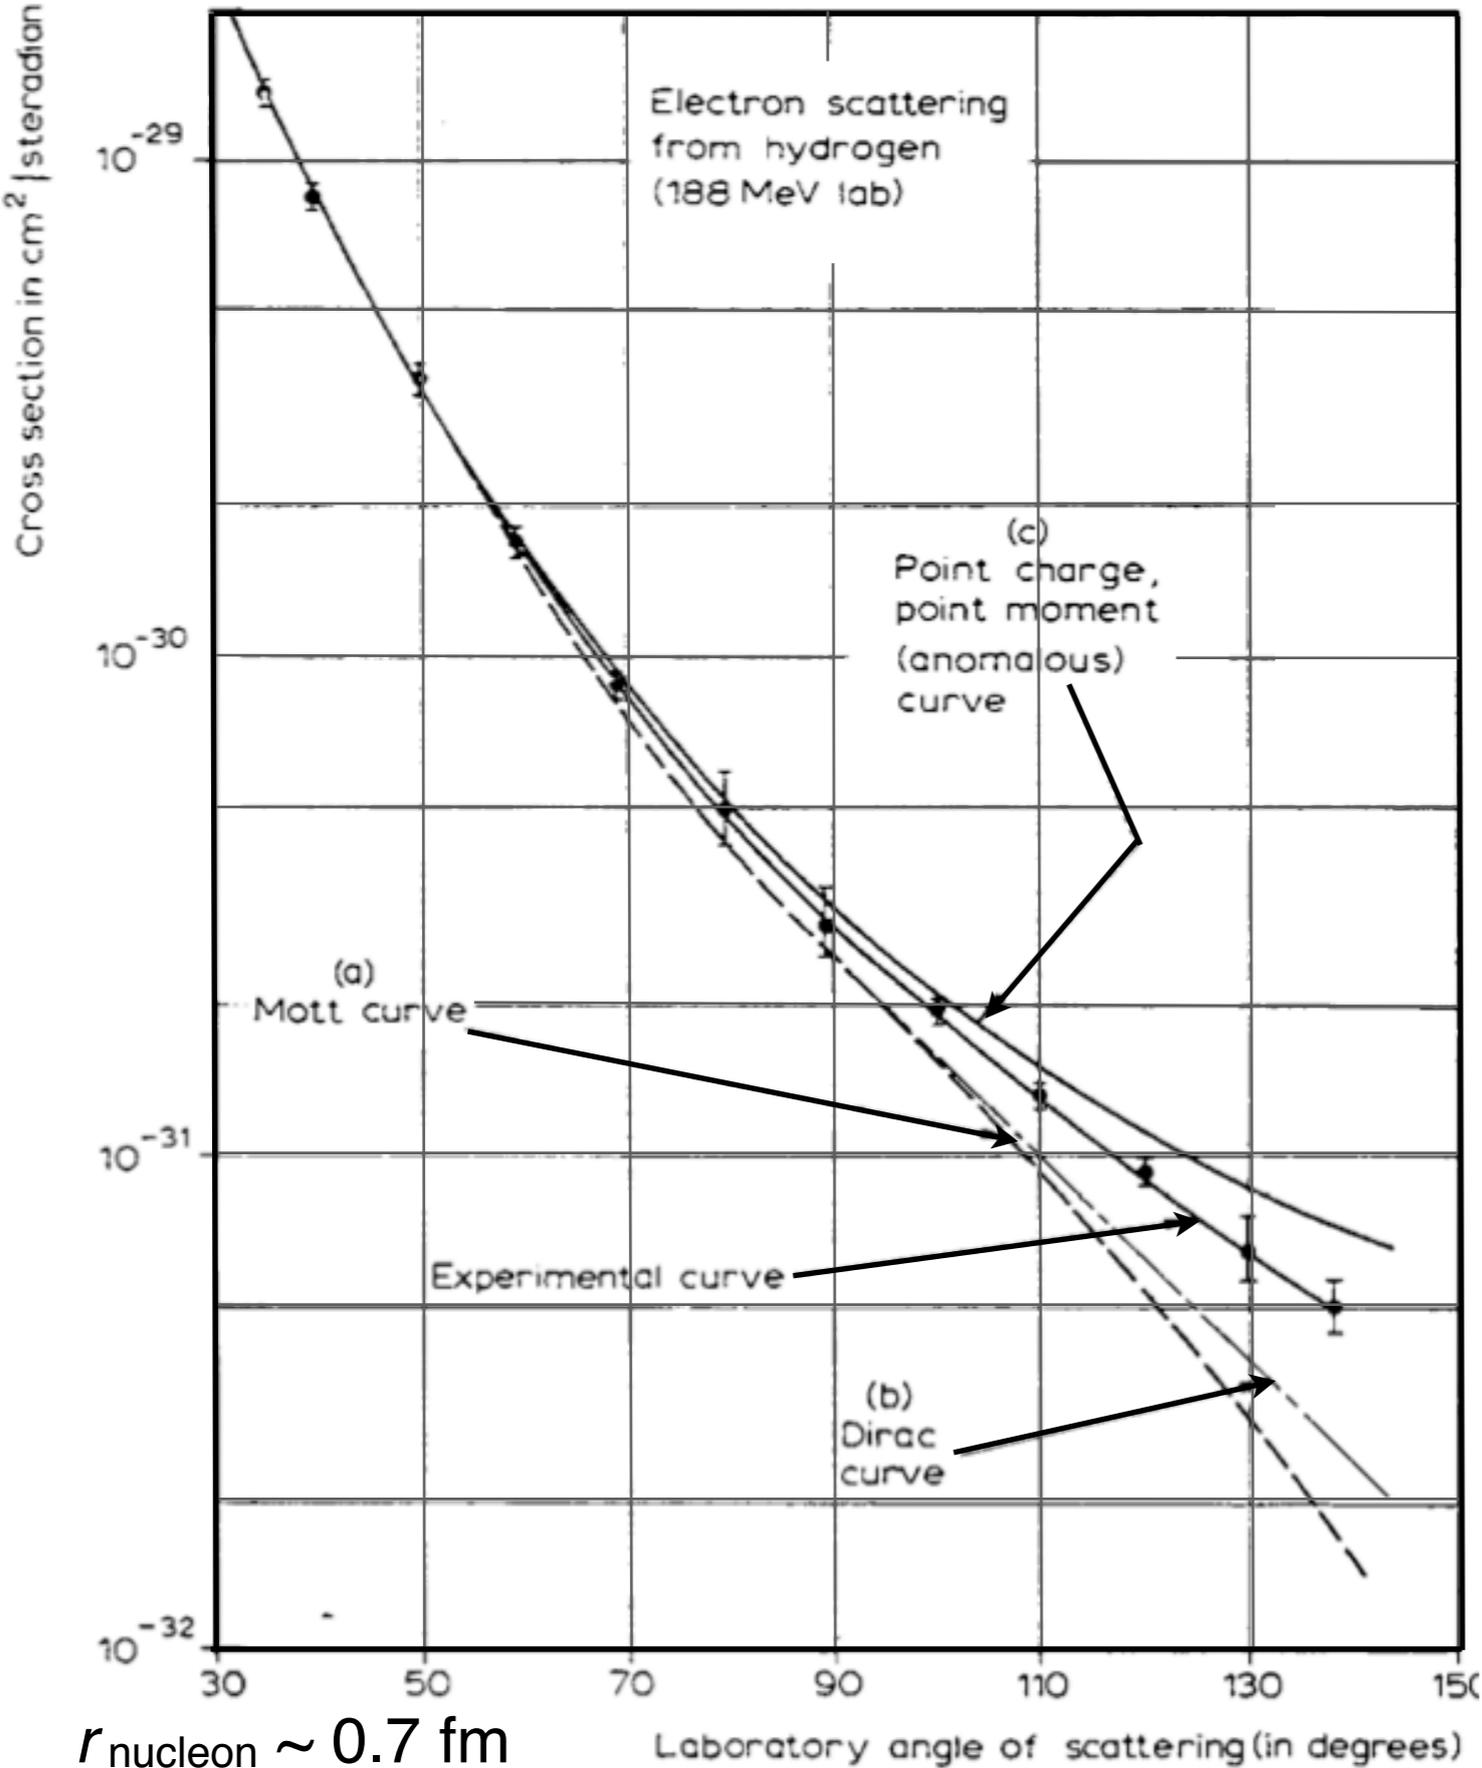

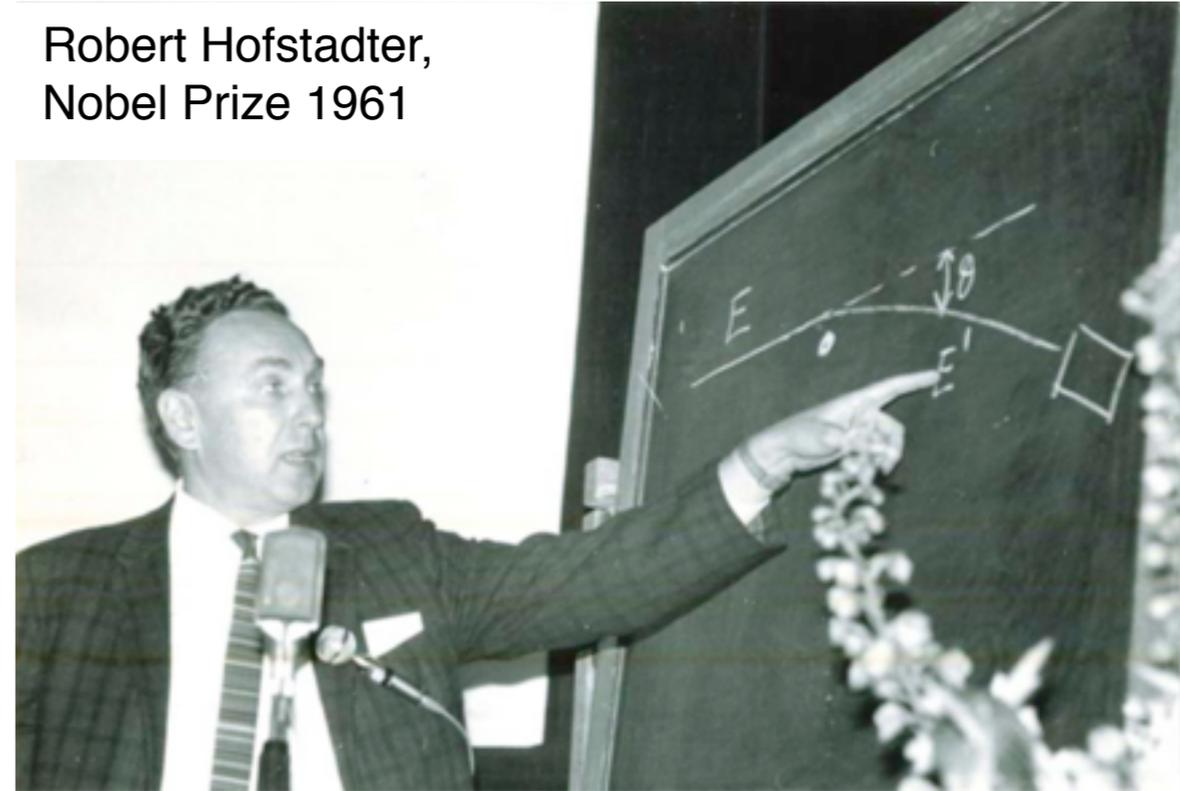

$$\frac{d\sigma}{d\Omega} = (zZ\alpha)^2 \left(\frac{\hbar c}{4E_{\text{kin}}} \right)^2 \frac{1}{\sin^4(\theta/2)}$$

Scattering off a hard sphere; $r_{\text{nucleus}} \sim (10^{-4} \cdot r_{\text{atom}}) \sim 10^{-14} \text{ m}$

~200 MeV

Elastic Electron Scattering

Scattering off a spin-1/2 Dirac particle:

$$\frac{d\sigma}{d\Omega} = \left(\frac{\alpha}{4ME \sin^2(\theta/2)} \right)^2 \frac{E'}{E} \left[\frac{q^2}{2M} \sin^2(\theta/2) + \cos^2(\theta/2) \right]$$

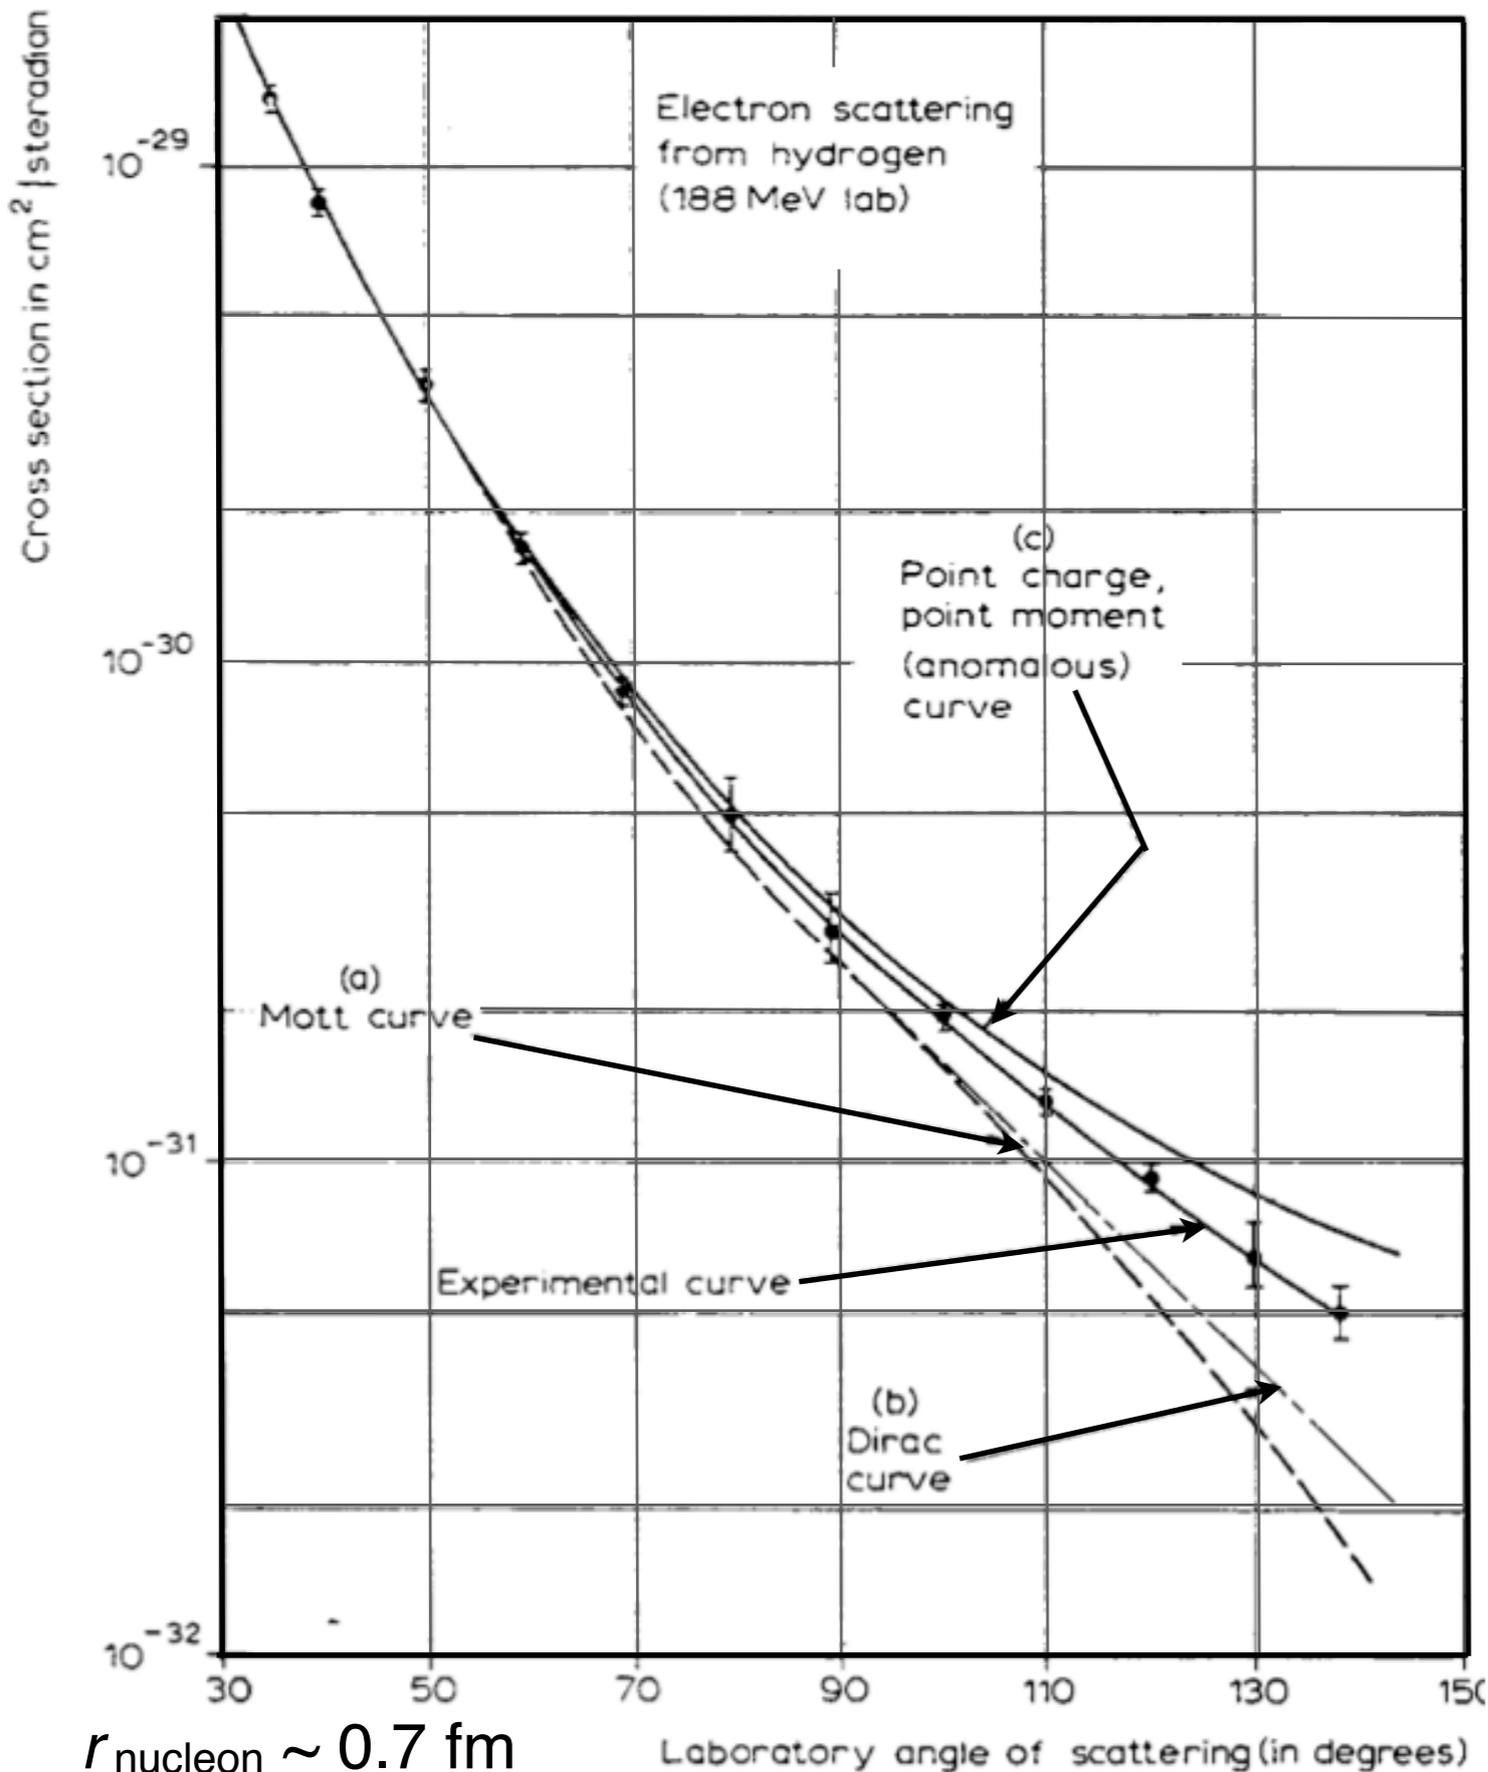

The proton has an anomalous magnetic moment,

$$g_p \neq 2, \quad g_p \simeq 5.6$$

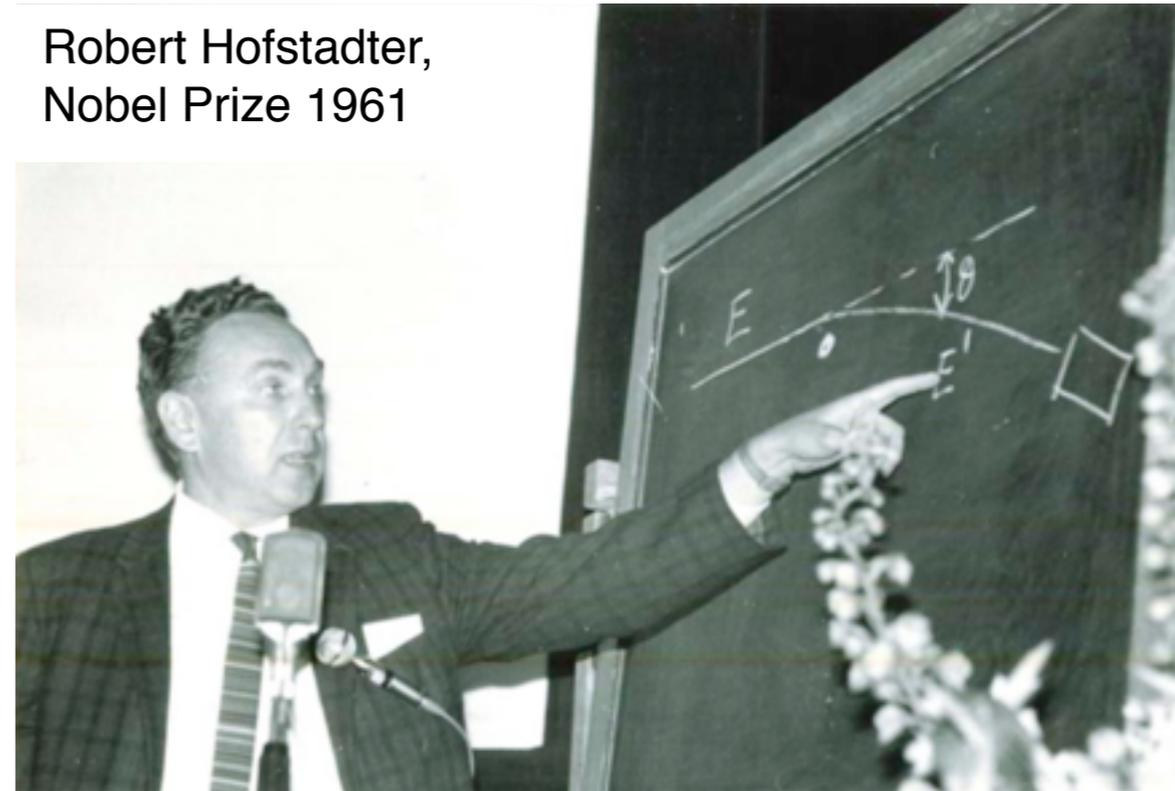

and, hence, internal (spin) structure.

~200 MeV

Elastic Electron Scattering

Robert Hofstadter,
Nobel Prize 1961

Scattering off a spin-1/2 Dirac particle:

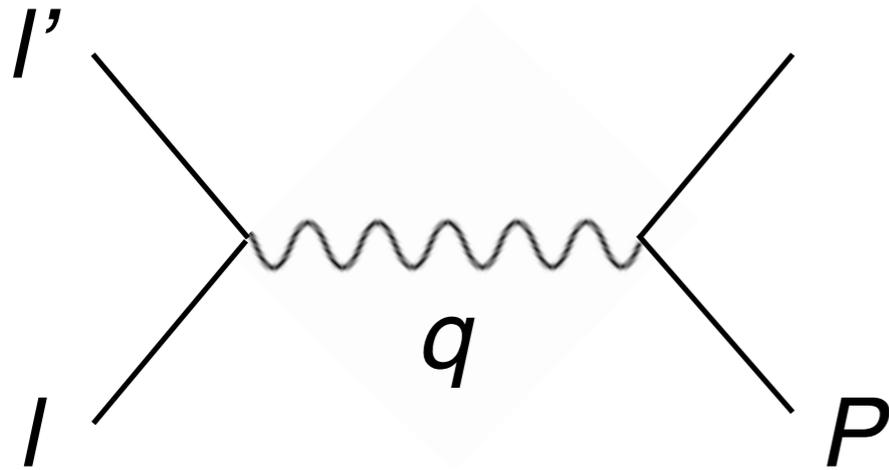

$$\frac{d\sigma}{d\Omega} = \left(\frac{\alpha}{4ME \sin^2(\theta/2)} \right)^2 \frac{E'}{E} \left[\frac{q^2}{2M} \sin^2(\theta/2) + \cos^2(\theta/2) \right]$$

The proton has an anomalous magnetic moment,

$$g_p \neq 2, \quad g_p \simeq 5.6$$

and, hence, internal (spin) structure.

Elastic Electron Scattering

$$d\sigma \propto \langle |\mathcal{M}|^2 \rangle = \frac{g_e^4}{q^4} L_{\text{lepton}}^{\mu\nu} K_{\mu\nu \text{ nucleon}}$$

The lepton tensor is calculable:

$$L_{\text{lepton}}^{\mu\nu} = 2 (k^\mu k'^\nu + k^\nu k'^\mu + g^{\mu\nu} (m^2 - k \cdot k'))$$

The nucleon tensor is not; it's general (spin-averaged, parity conserved) form is:

$$K_{\mu\nu \text{ nucleon}} = -K_1 g_{\mu\nu} + \frac{K_2}{M^2} p_\mu p_\nu + \frac{K_4}{M^2} q_\mu q_\nu + \frac{K_5}{M^2} (p_\mu q_\nu + p_\nu q_\mu)$$

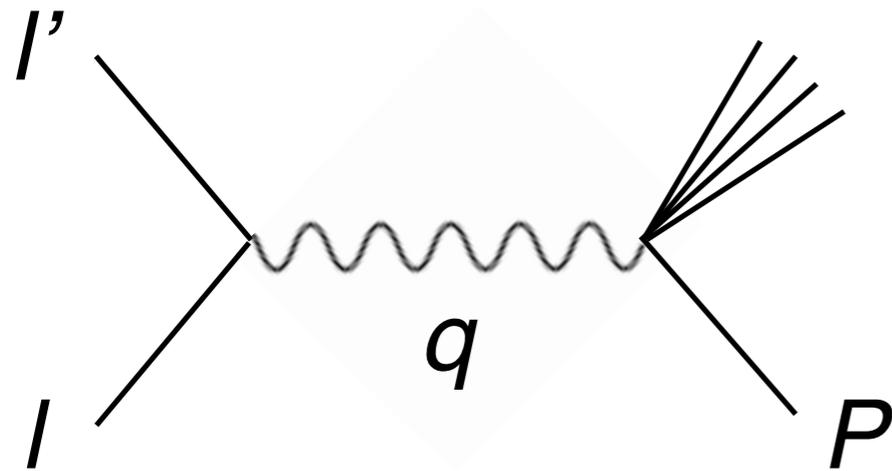

Charge conservation at the proton vertex reduces the number of structure functions:

$$q_\mu K_{\text{nucleon}}^{\mu\nu} \rightarrow K_4 = f(K_1, K_2), \quad K_5 = g(K_2)$$

and one obtains the Rosenbluth form, with electric and magnetic form factors:

$$\frac{d\sigma}{d\Omega} = \left(\frac{\alpha}{4ME \sin^2(\theta/2)} \right)^2 \frac{E'}{E} [2K_1 \sin^2(\theta/2) + K_2 \cos^2(\theta/2)], \quad K_{1,2}(q^2)$$

Inelastic Scattering

Considerably more complex, indeed!

Simplify - consider *inclusive* inelastic scattering,

$$d\sigma \propto \langle |\mathcal{M}|^2 \rangle = \frac{g_e^4}{q^4} L_{\text{lepton}}^{\mu\nu} W_{\mu\nu \text{ nucleon}}, \quad W_{\mu\nu \text{ nucleon}}(p, q)$$

Again, two (parity-conserving, spin-averaged) structure functions:

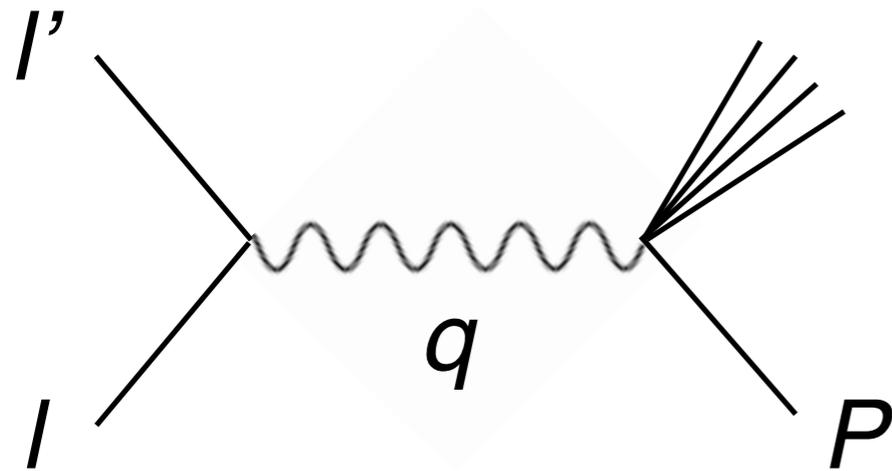

$$W_1, W_2 \quad \text{or, alternatively expressed, } F_1, F_2$$

which may depend on two invariants,

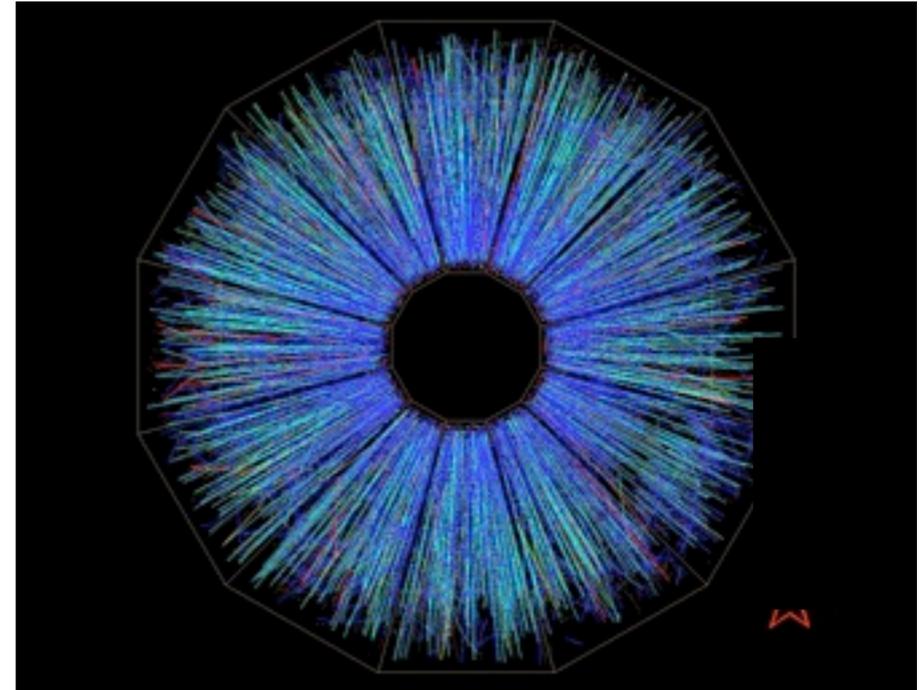

$$Q^2 = -q^2, \quad x = \frac{q^2}{2q \cdot p}, \quad 0 < x < 1$$

So much for the structure, the physics is in the structure functions.

Inelastic Scattering

Not convinced of additional complexity?

Then forget this talk, and calculate this!

$$W_{\mu\nu \text{ nucleon}}(p, q)$$

Simplify - consider *inclusive* inelastic scattering,

$$d\sigma \propto \langle |\mathcal{M}|^2 \rangle = \frac{g_e^4}{q^4} L_{\text{lepton}}^{\mu\nu} W_{\mu\nu \text{ nucleon}},$$

Again, two (parity-conserving, spin-averaged) structure functions:

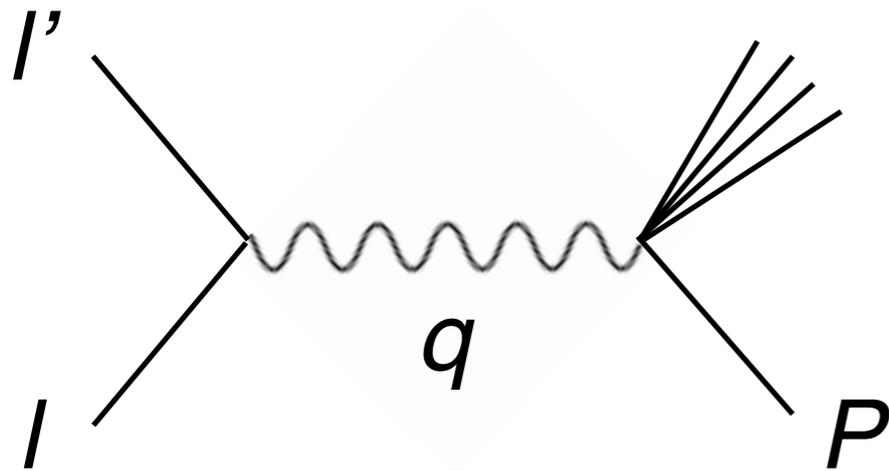

$$W_1, W_2 \text{ or, alternatively expressed, } F_1, F_2$$

which may depend on two invariants,

$$Q^2 = -q^2, \quad x = \frac{q^2}{2q \cdot p}, \quad 0 < x < 1$$

So much for the structure, the physics is in the structure functions.

Inelastic Scattering

Considerably more complex, indeed!

Simplify - consider *inclusive* inelastic scattering,

$$d\sigma \propto \langle |\mathcal{M}|^2 \rangle = \frac{g_e^4}{q^4} L_{\text{lepton}}^{\mu\nu} W_{\mu\nu \text{ nucleon}}, \quad W_{\mu\nu \text{ nucleon}}(p, q)$$

Again, two (parity-conserving, spin-averaged) structure functions:

$$W_1, W_2 \quad \text{or, alternatively expressed, } F_1, F_2$$

which may depend on two invariants,

$$Q^2 = -q^2, \quad x = \frac{q^2}{2q \cdot p}, \quad 0 < x < 1$$

So much for the structure, the physics is in the structure functions.

Elastic scattering off Dirac Protons

Compare:

$$L_{\text{lepton}}^{\mu\nu} = 2 (k^\mu k'^\nu + k^\nu k'^\mu + g^{\mu\nu} (m^2 - k \cdot k'))$$

with:

$$K_{\mu\nu \text{ nucleon}} = K_1 \left(-g_{\mu\nu} + \frac{q^\mu q^\nu}{q^2} \right) + \frac{K_2}{M^2} \left(p^\mu + \frac{1}{2} q^\mu \right) \left(p^\nu + \frac{1}{2} q^\nu \right)$$

which uses the relations between $K_{1,2}$ and $K_{4,5}$

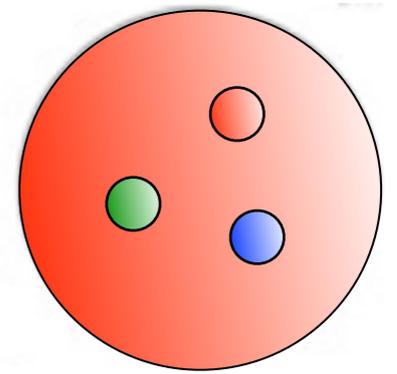

Then, e.g. by substitution of $k' = k - q$ in L :

$$K_1 = -q^2, \quad K_2 = 4M^2$$

Note, furthermore, that inelastic cross section reduces to the elastic one for:

$$W_{1,2}(q^2, x) = -\frac{K_{1,2}(q^2)}{2Mq^2} \delta(x - 1)$$

Elastic scattering off Dirac Partons

Imagine *incoherent* scattering off *Dirac* Partons (quarks) q :

$$W_1^q = \frac{e_q^2}{2m_q} \delta(x_q - 1), \quad W_2^q = -\frac{2m_q e_q^2}{q^2} \delta(x_q - 1) \quad \text{and} \quad x_q = -\frac{q^2}{2q \cdot p_q}$$

and, furthermore suppose that the quarks carry a fraction, z , of the proton momentum

$$p_q = z_q p, \quad \text{so that} \quad x_q = \frac{x}{z_q} \quad (\text{also note } m_q = z_q M !)$$

which uses the relations between $K_{1,2}$ and $K_{4,5}$

Now,

$$MW_1 = \sum_q \int_0^1 \frac{e_q^2}{2M} \delta(x - z_q) f_q(z_q) dz_q = \frac{1}{2} \sum_q e_q^2 f_q(x) \equiv F_1(x)$$

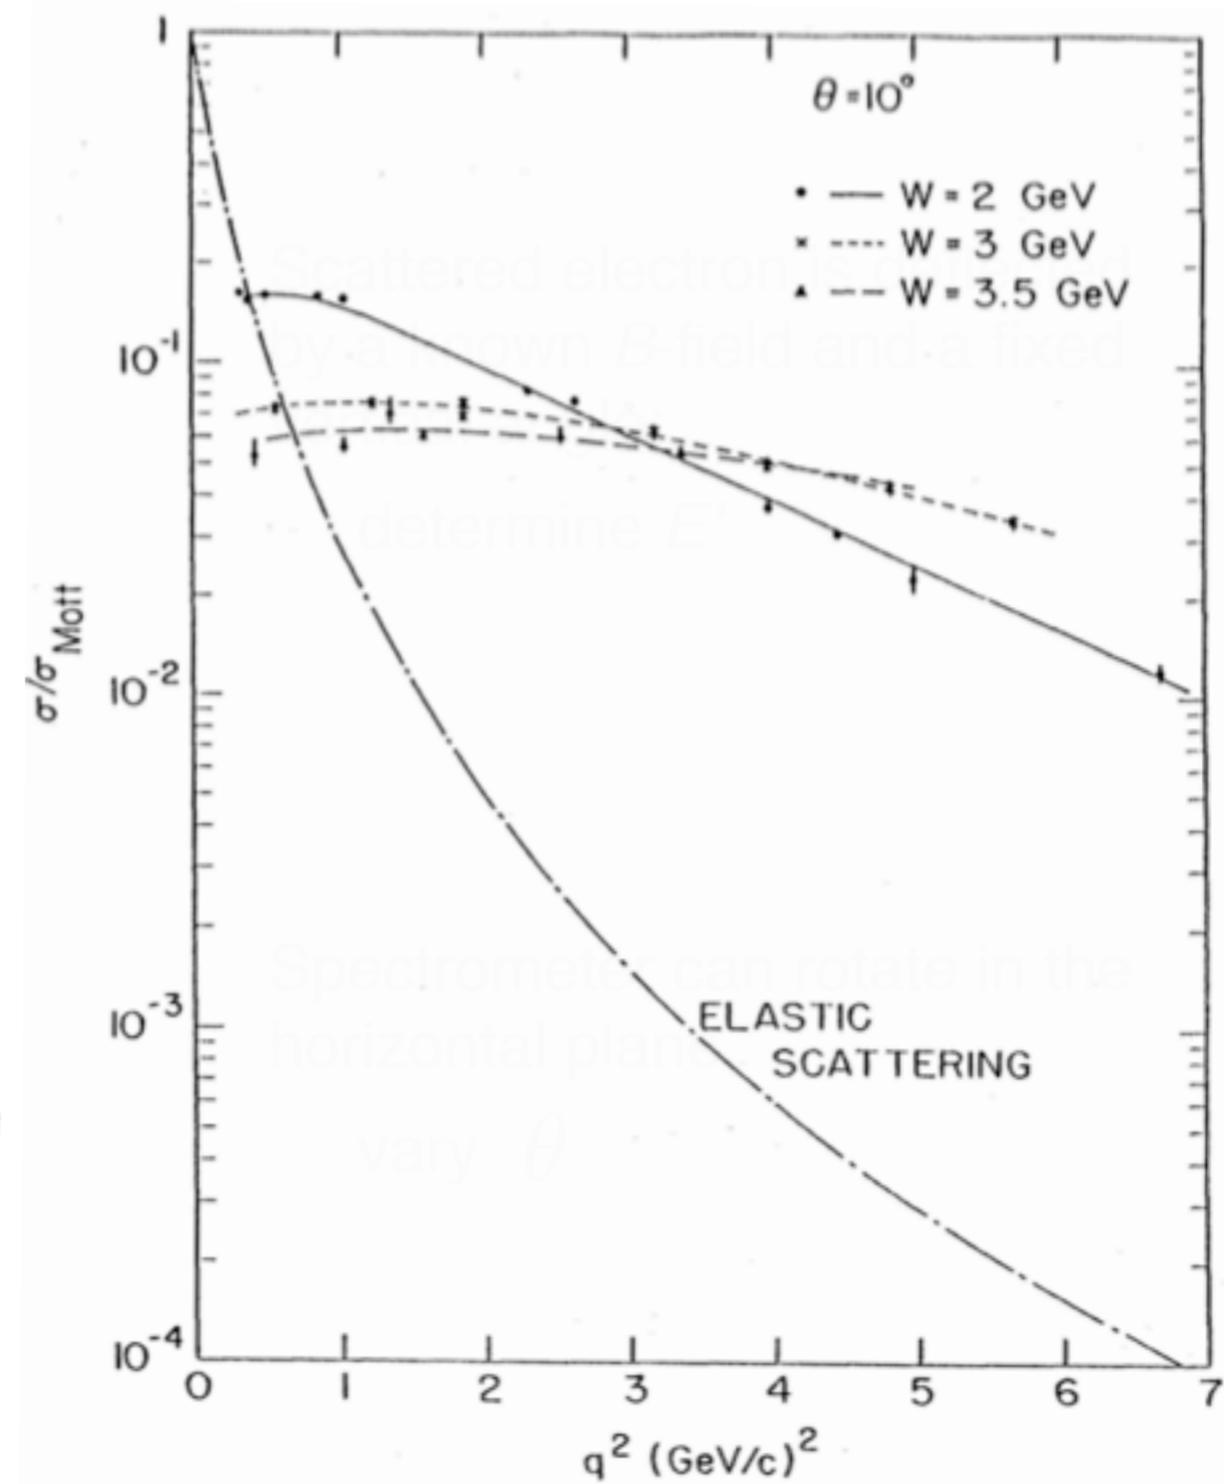

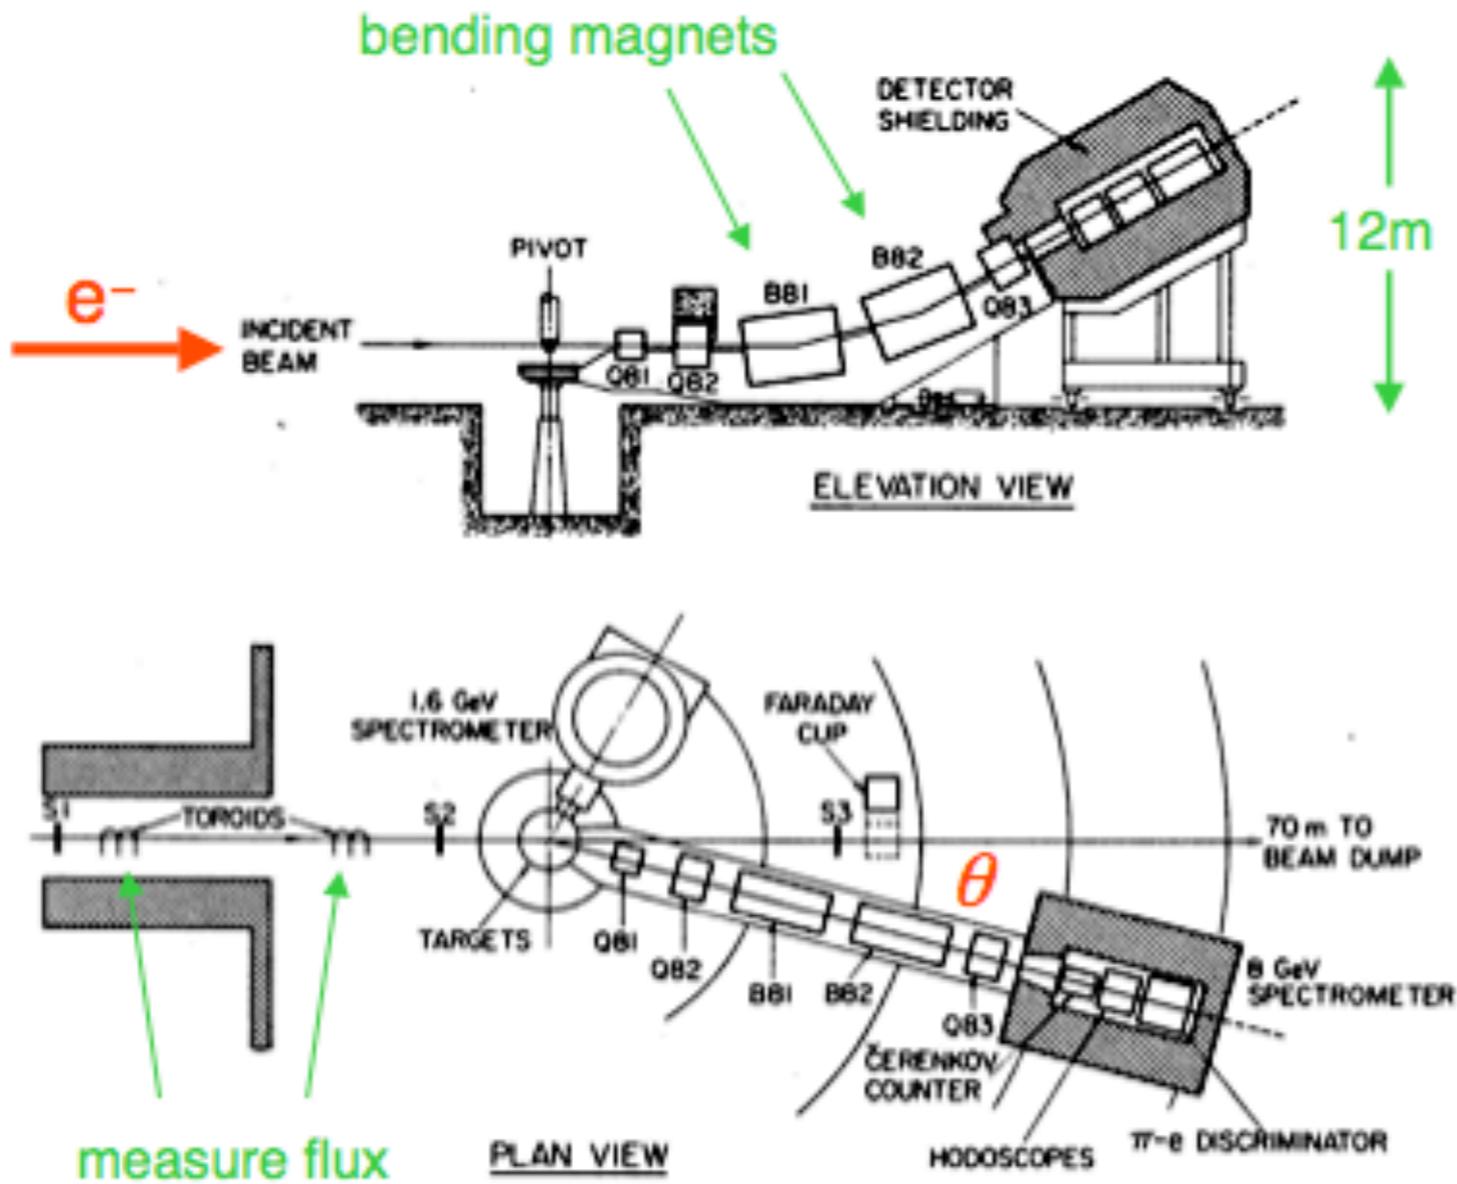

$$-\frac{q^2}{2Mx} W_2 = \int_0^1 x e_q^2 \delta(x - z_q) f_q(z_q) dz_q = x \sum_q e_q^2 f_q(x) \equiv F_2(x)$$

Two important *observable* consequences,

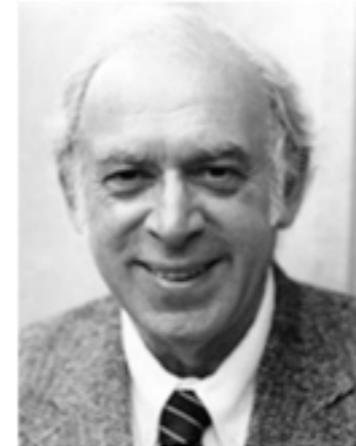

Bjorken scaling: $F_{1,2}(x)$, not $F_{1,2}(x, Q^2)$

Callan-Gross relation: $F_2 = 2xF_1(x)$

~ 10 GeV *Deep-Inelastic* Electron Scattering

Deep-Inelastic Electron Scattering

J.T. Friedman

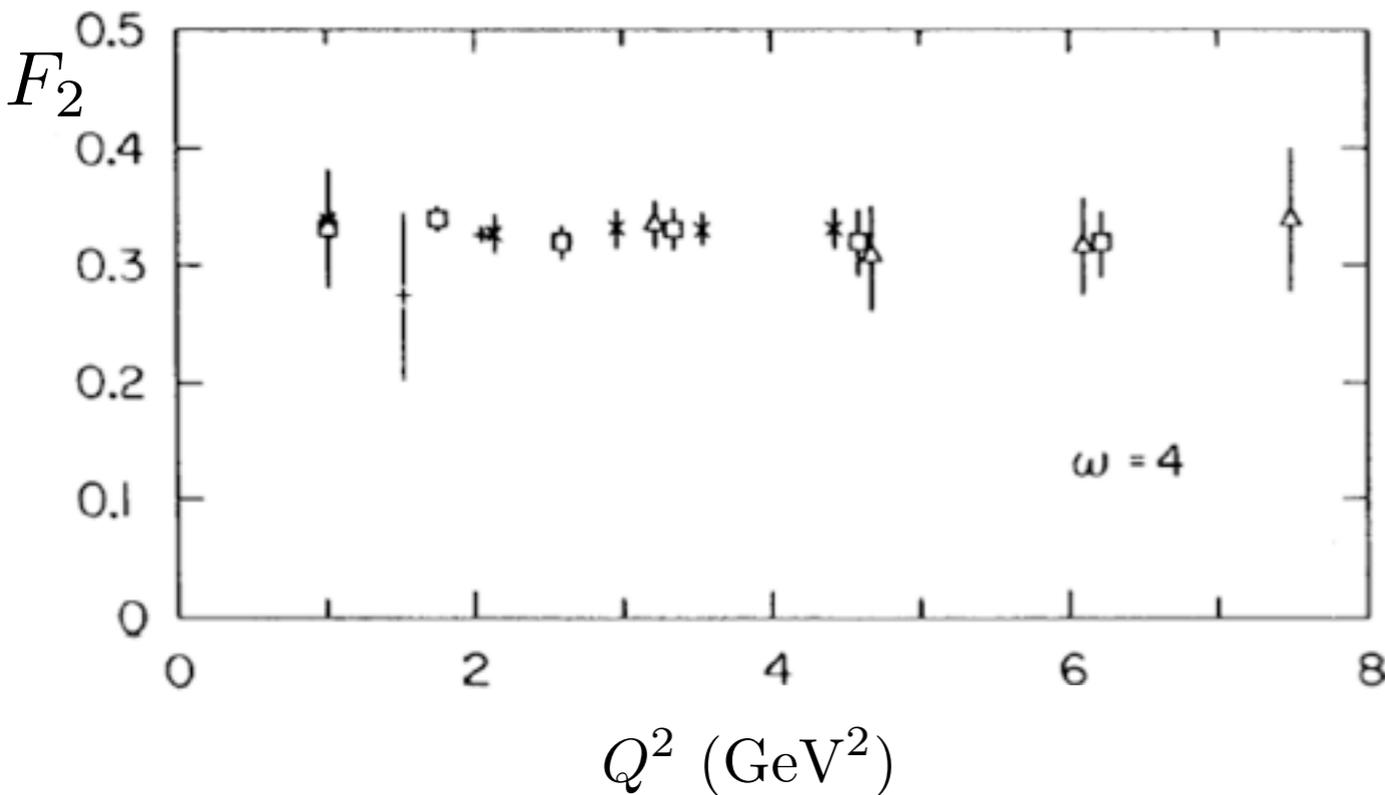

R. Taylor
Nobel Prize 1990

H.W. Kendall

Bjorken scaling:

+ 6° □ 18°
× 10° △ 26°

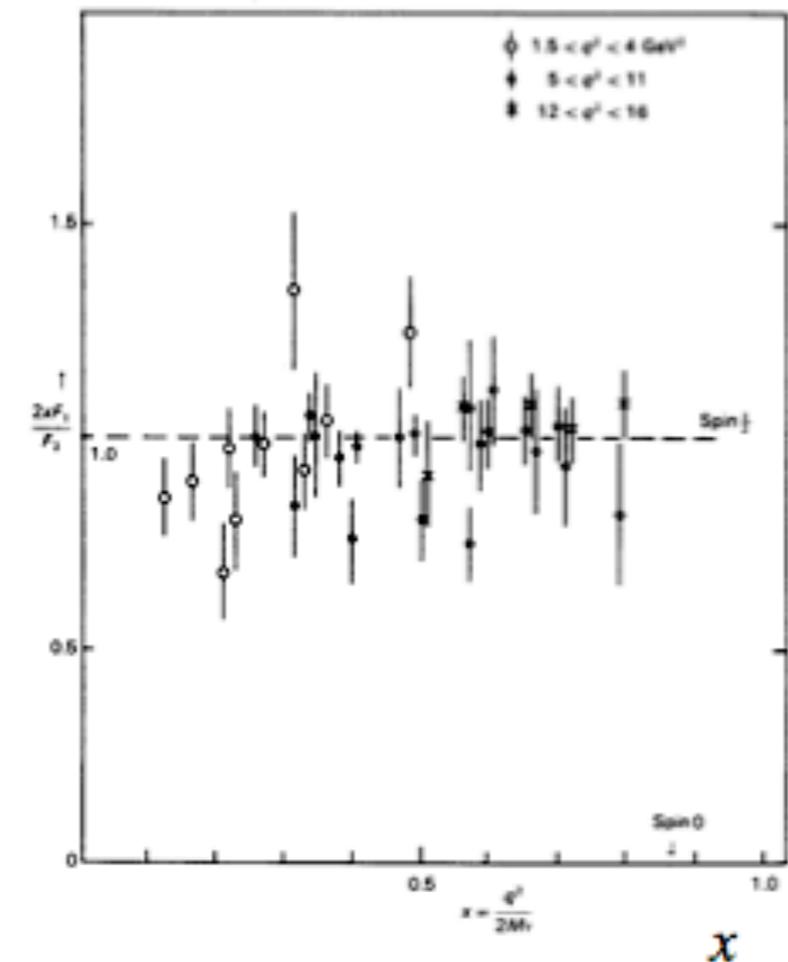

Point particles cannot be further resolved; their measurement does not depend on wavelength, hence Q^2 ,

Spin-1/2 quarks cannot absorb longitudinally polarized vector bosons and, conversely, spin-0 (scalar) quarks cannot absorb transversely polarized photons.

Callan-Gross relation:

$$\frac{2xF_1}{F_2}$$

← spin 1/2

← spin 0

Deep-Inelastic *Neutrino* Scattering

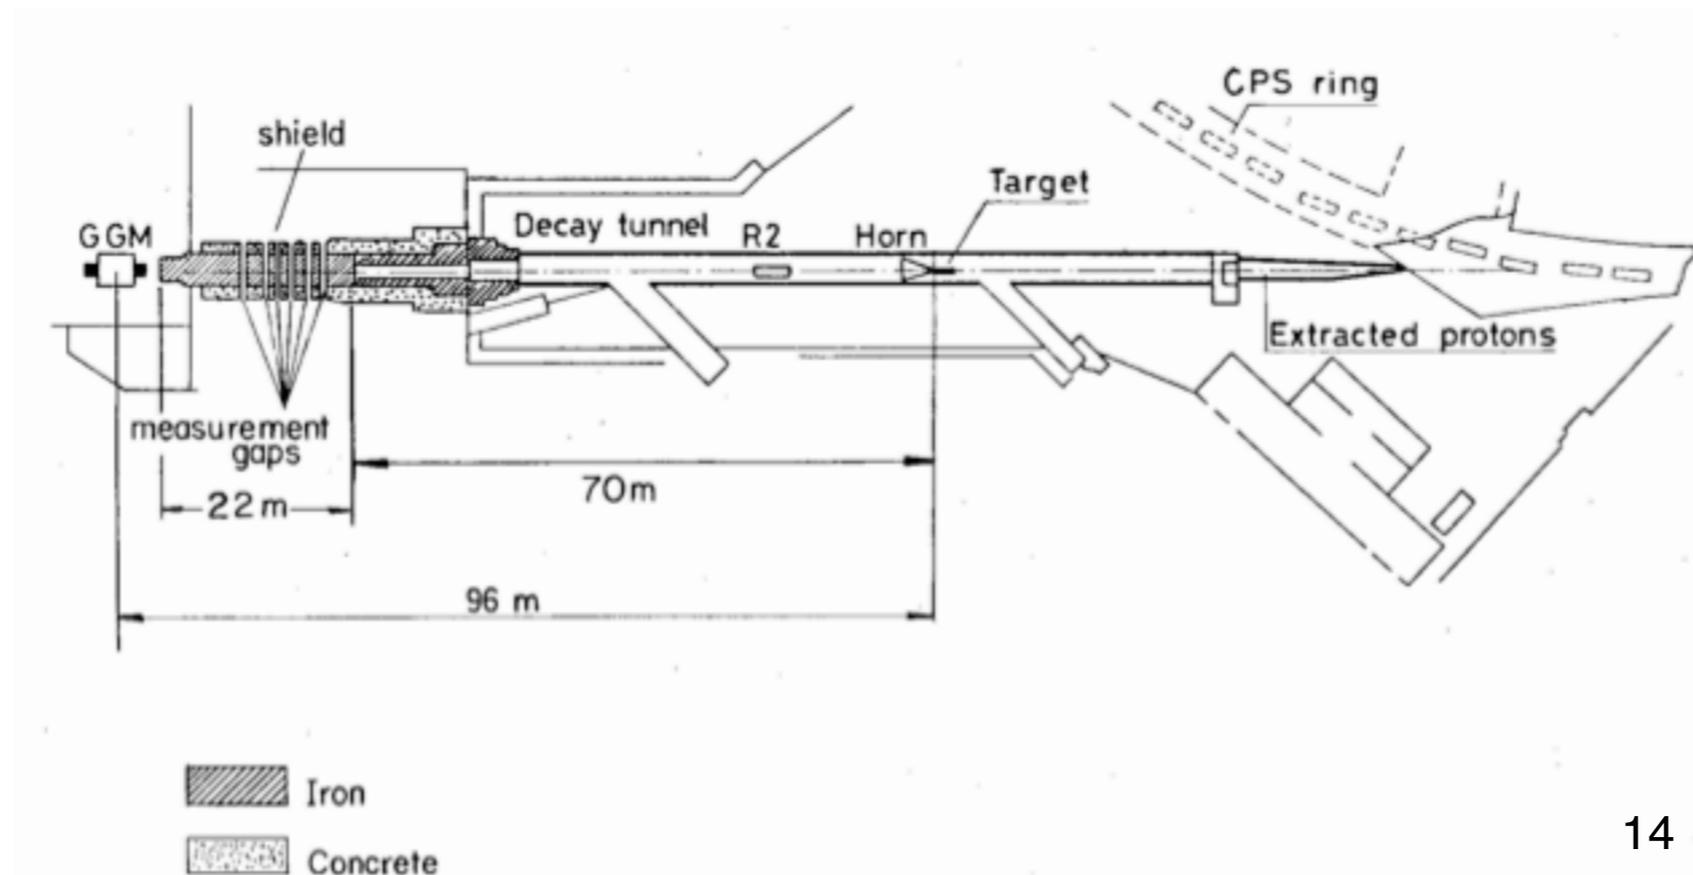

Recognize this from CERN?

*Gargamelle bubble chamber,
observation of weak neutral
current (1973).*

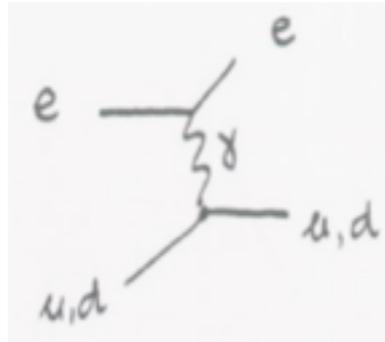

Charged-current DIS!

- Nucl.Phys. **B73** (1974) 1
- Nucl.Phys. **B85** (1975) 269
- Nucl.Phys. **B118** (1977) 218
- Phys.Lett. **B74** (1978) 134

Deep-Inelastic Scattering - Fractional Electric Charges

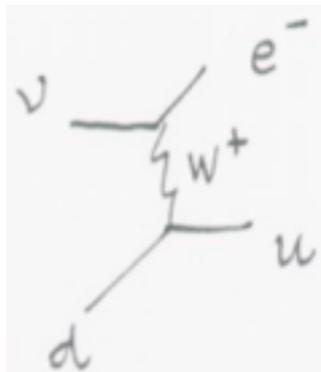

Neutral-current (photon) DIS:

$$F_2 = x \sum e_q^2 (q + \bar{q}), \quad p : uud, \quad n : ddu$$

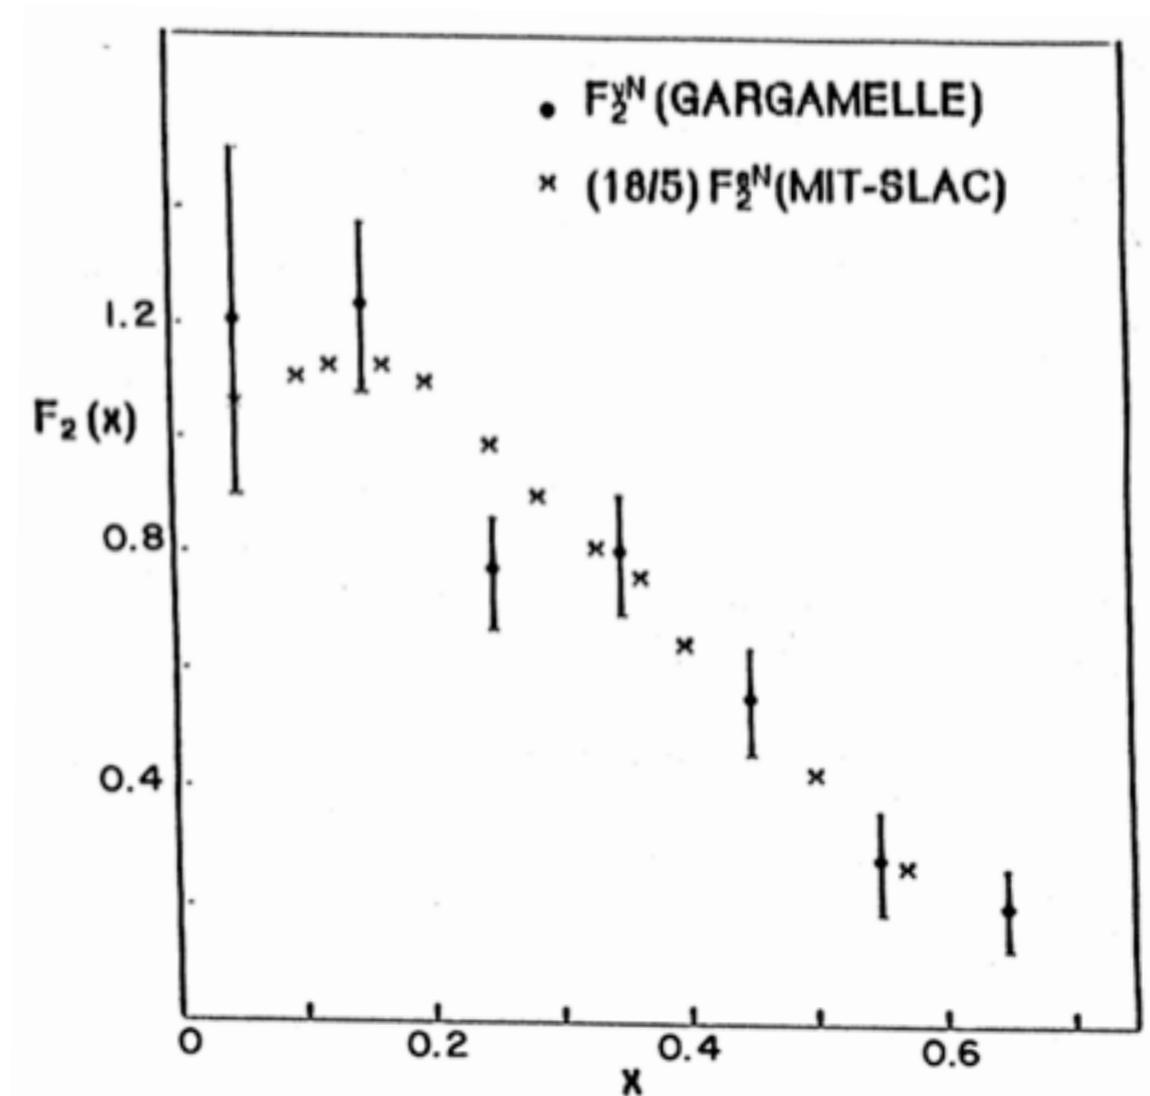

$$F_2^N = x \frac{e_u^2 + e_d^2}{2} (u + \bar{u} + d + \bar{d})$$

Charged-current DIS:

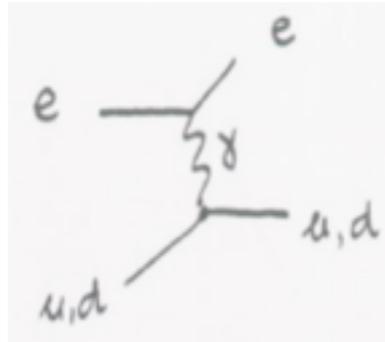

$$F_2^{\nu p} = 2x(d + \bar{u}), \quad F_2^{\nu n} = 2x(u + \bar{d})$$

$$F_2^{\nu N} = x(u + \bar{u} + d + \bar{d})$$

Deep-Inelastic Scattering - Fractional Electric Charges

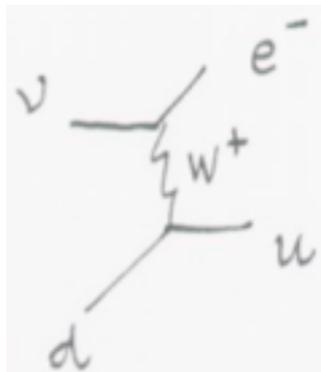

Neutral-current (photon) DIS:

$$F_2 = x \sum e_q^2 (q + \bar{q}), \quad p : uud, \quad n : ddu$$

$$F_2^N = x \frac{e_u^2 + e_d^2}{2} (u + \bar{u} + d + \bar{d})$$

Charged-current DIS:

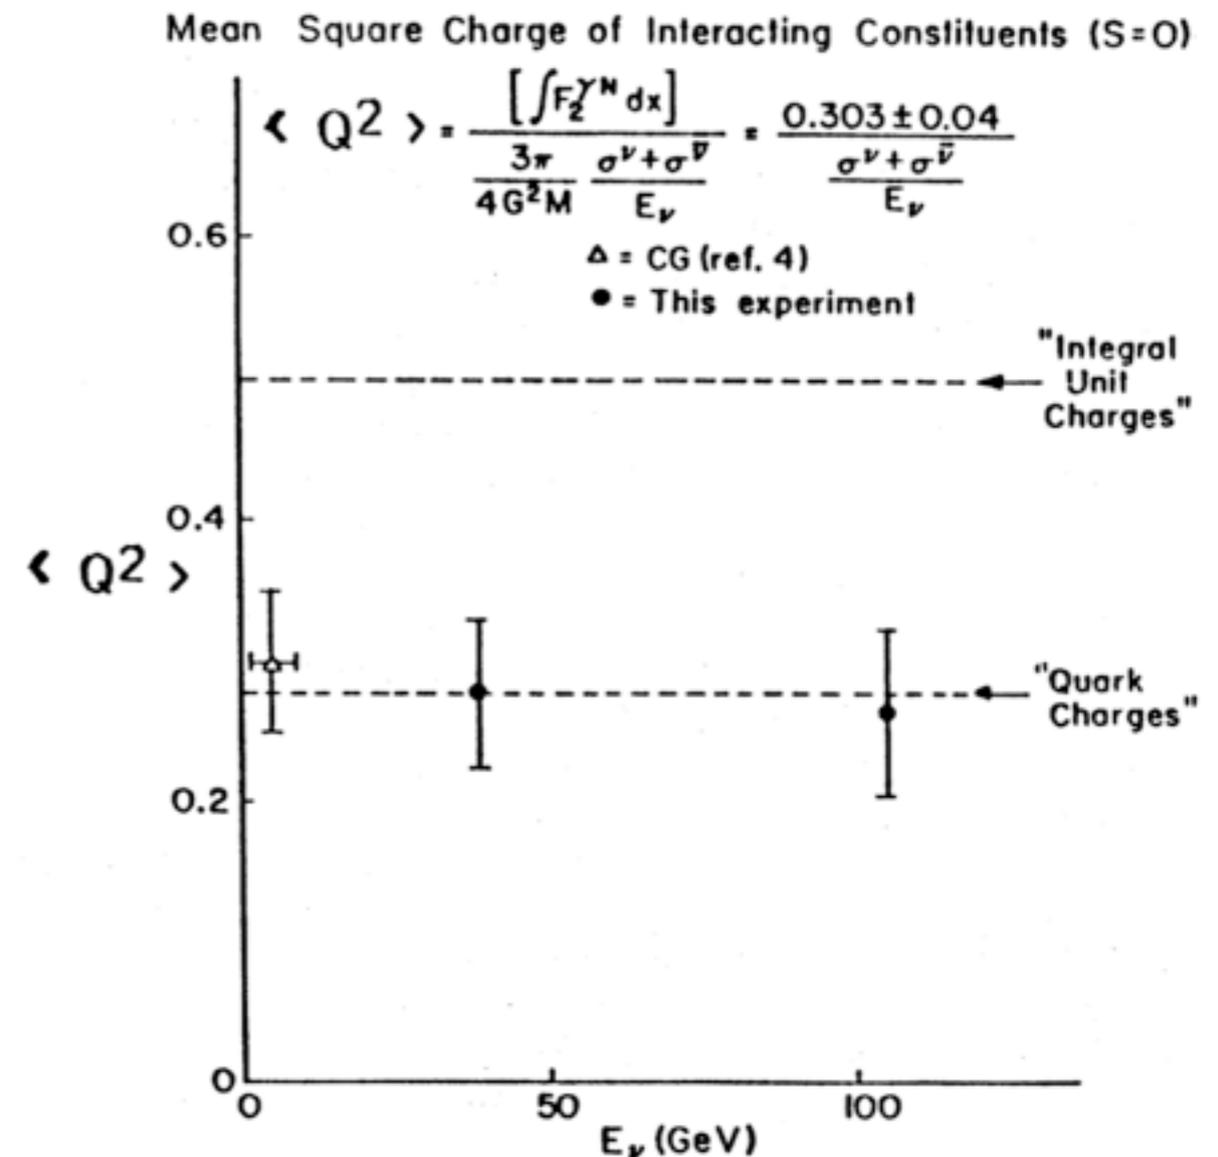

$$F_2^{\nu p} = 2x(d + \bar{u}), \quad F_2^{\nu n} = 2x(u + \bar{d})$$

$$F_2^{\nu N} = x(u + \bar{u} + d + \bar{d})$$

Ratio:

$$\frac{F_2^N}{F_2^{\nu N}} = \frac{1}{2} (e_u^2 + e_d^2) = \frac{5}{18} \simeq 0.28$$

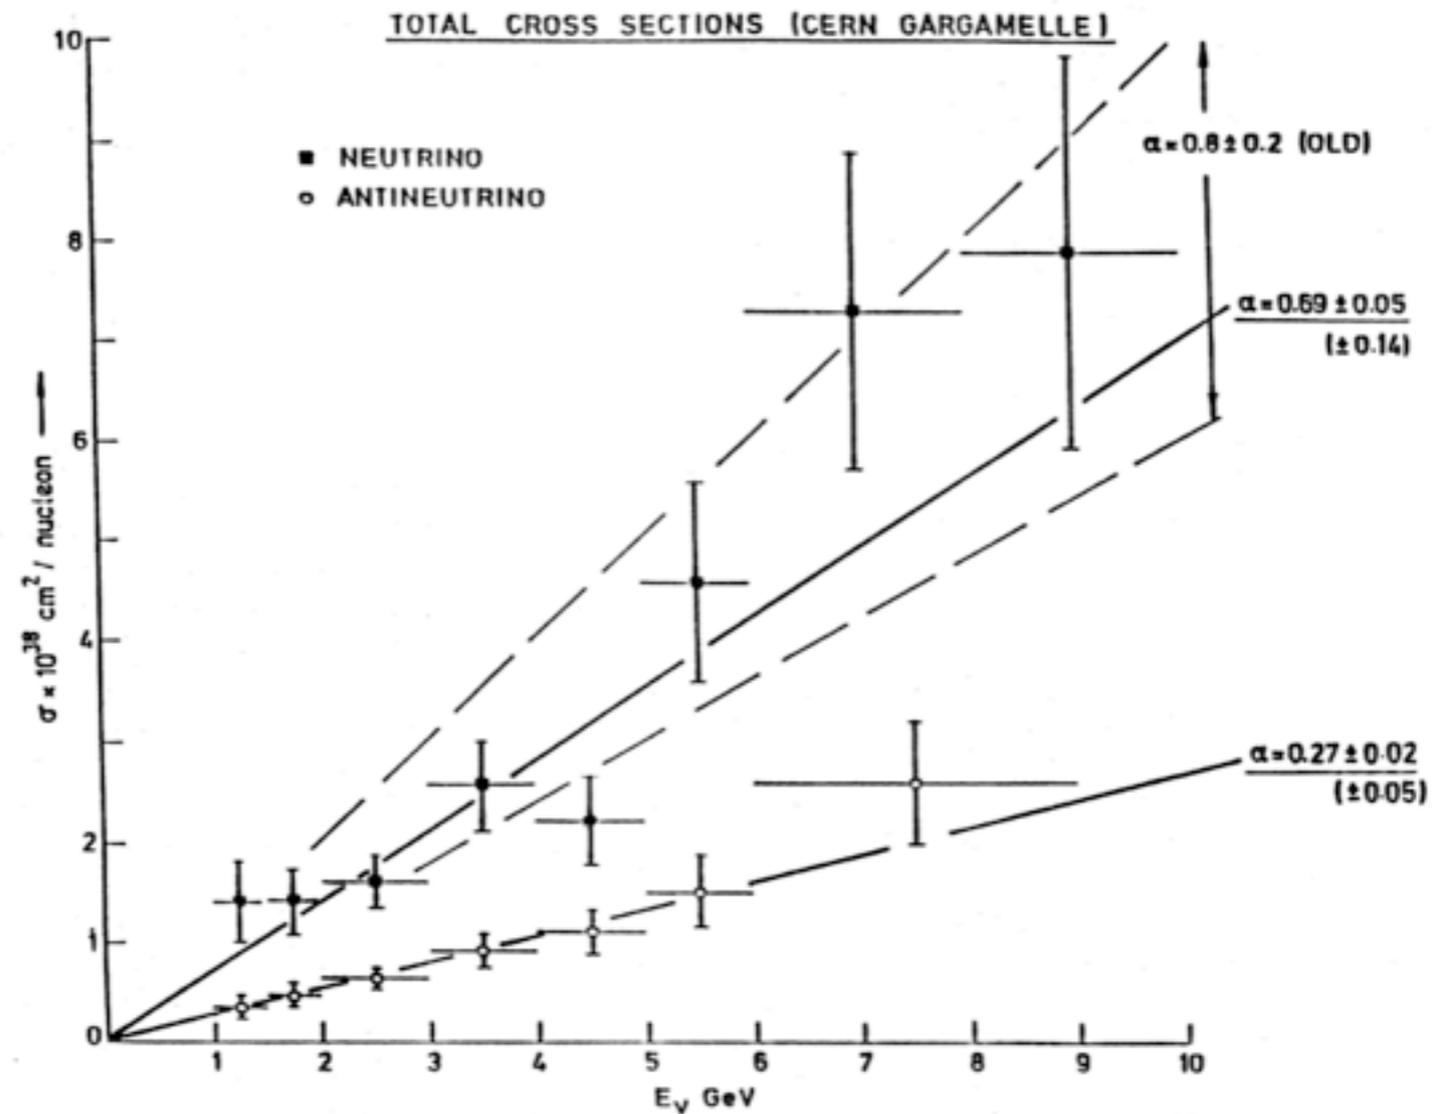

Deep-Inelastic Scattering - Valence and Sea Quarks

Charged-current DIS:

$$F_2^\nu = 2x \sum (q + \bar{q})$$

$$xF_3^{\nu N} = 2x \sum (q - \bar{q})$$

$$\int_0^1 xF_3^{\nu N} \frac{dx}{x} = \int_0^1 (u_v + d_v) dx$$

Gross Llewellyn-Smith: 3

Gargamelle: 3.2 +/- 0.6

$$\frac{d^2 \sigma^{\bar{\nu} N}}{dx dy} \propto [\bar{u} + \bar{d} + (u + d)(1 - y)^2]$$

$$\frac{d^2 \sigma^{\nu N}}{dx dy} \propto [u + d + (\bar{u} + \bar{d})(1 - y)^2]$$

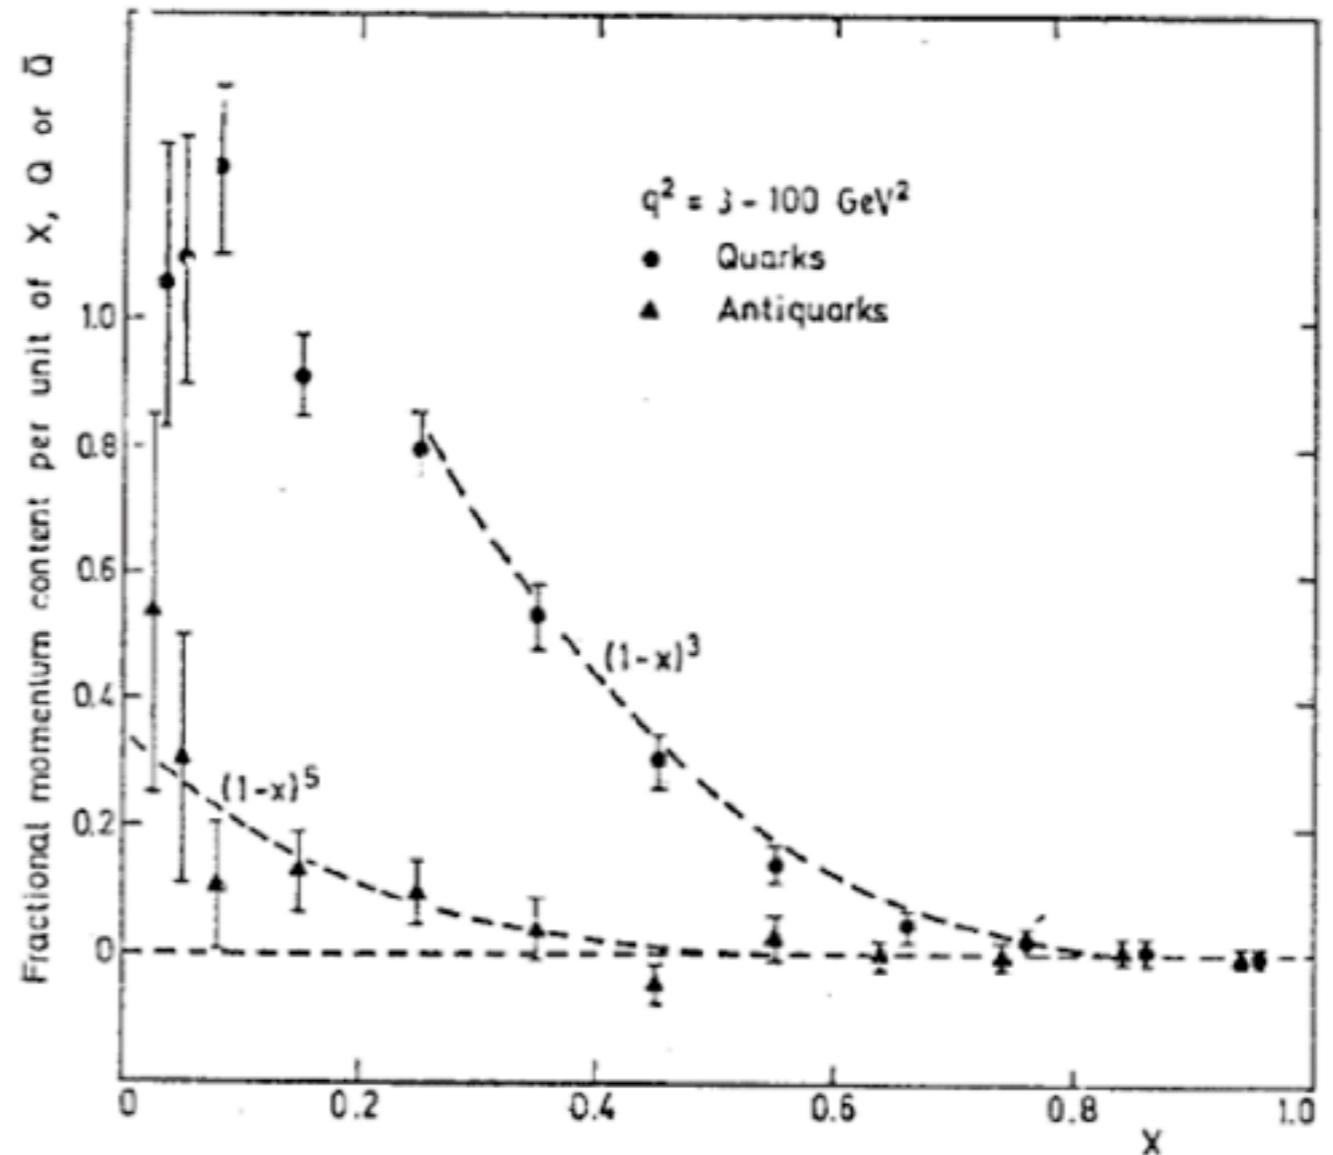

Deep-Inelastic Scattering - Valence and Sea Quarks

Charged-current DIS:

$$F_2^\nu = 2x \sum (q + \bar{q})$$

$$xF_3^{\nu N} = 2x \sum (q - \bar{q})$$

$$\int_0^1 xF_3^{\nu N} \frac{dx}{x} = \int_0^1 (u_v + d_v) dx$$

Gross Llewellyn-Smith: 3

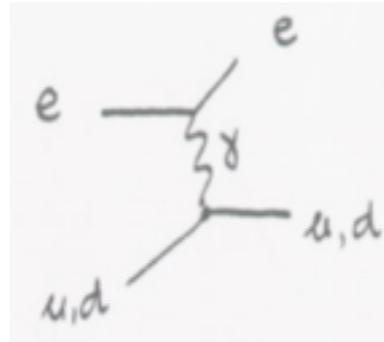

Gargamelle: 3.2 +/- 0.6

$$\frac{d^2 \sigma^{\bar{\nu} N}}{dx dy} \propto [\bar{u} + \bar{d} + (u + d)(1 - y)^2]$$

$$\frac{d^2 \sigma^{\nu N}}{dx dy} \propto [u + d + (\bar{u} + \bar{d})(1 - y)^2]$$

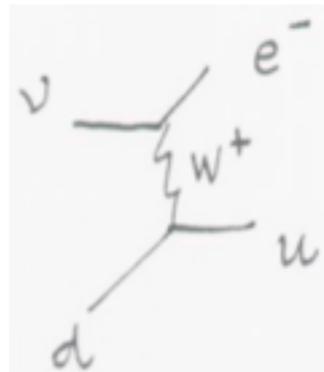

Deep-Inelastic Scattering - Momentum Conservation

Neutral-current (photon) DIS:

$$F_2^N = x \frac{e_u^2 + e_d^2}{2} (u + \bar{u} + d + \bar{d})$$

Charged-current DIS:

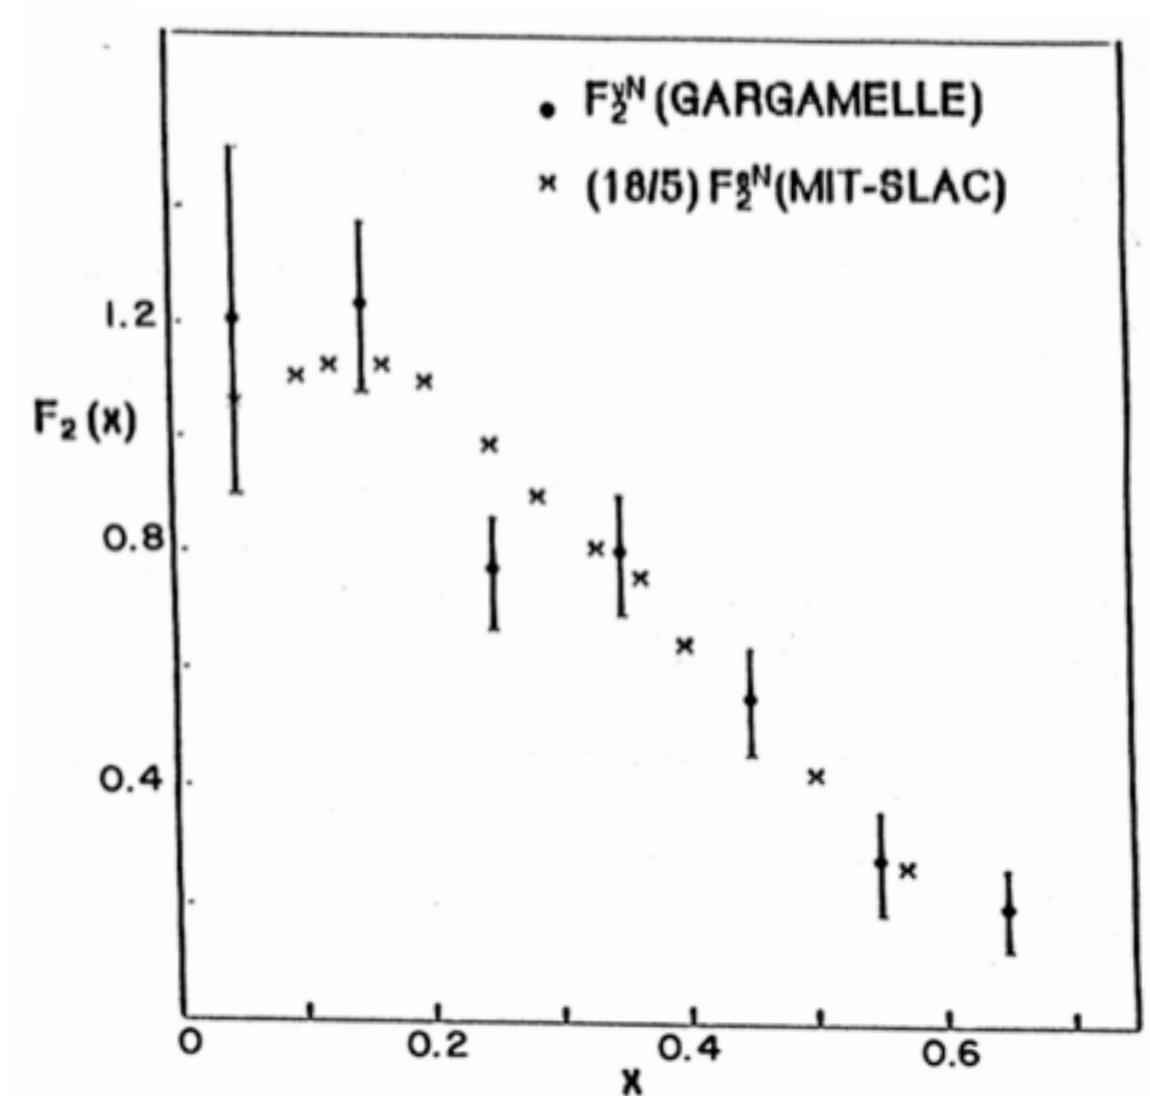

$$F_2^{\nu N} = x(u + \bar{u} + d + \bar{d})$$

Momentum fraction:

$$\int_0^1 F_2^N dx = \frac{e_u^2 + e_d^2}{2} \int_0^1 x(u + \bar{u} + d + \bar{d})$$

Gargamelle: 0.49 +/- 0.07

SLAC: 0.14 +/- 0.05

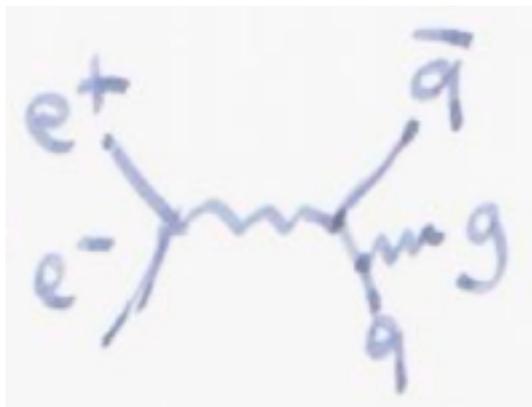

Quarks carry half of the nucleon momentum!

3-jet events at PETRA

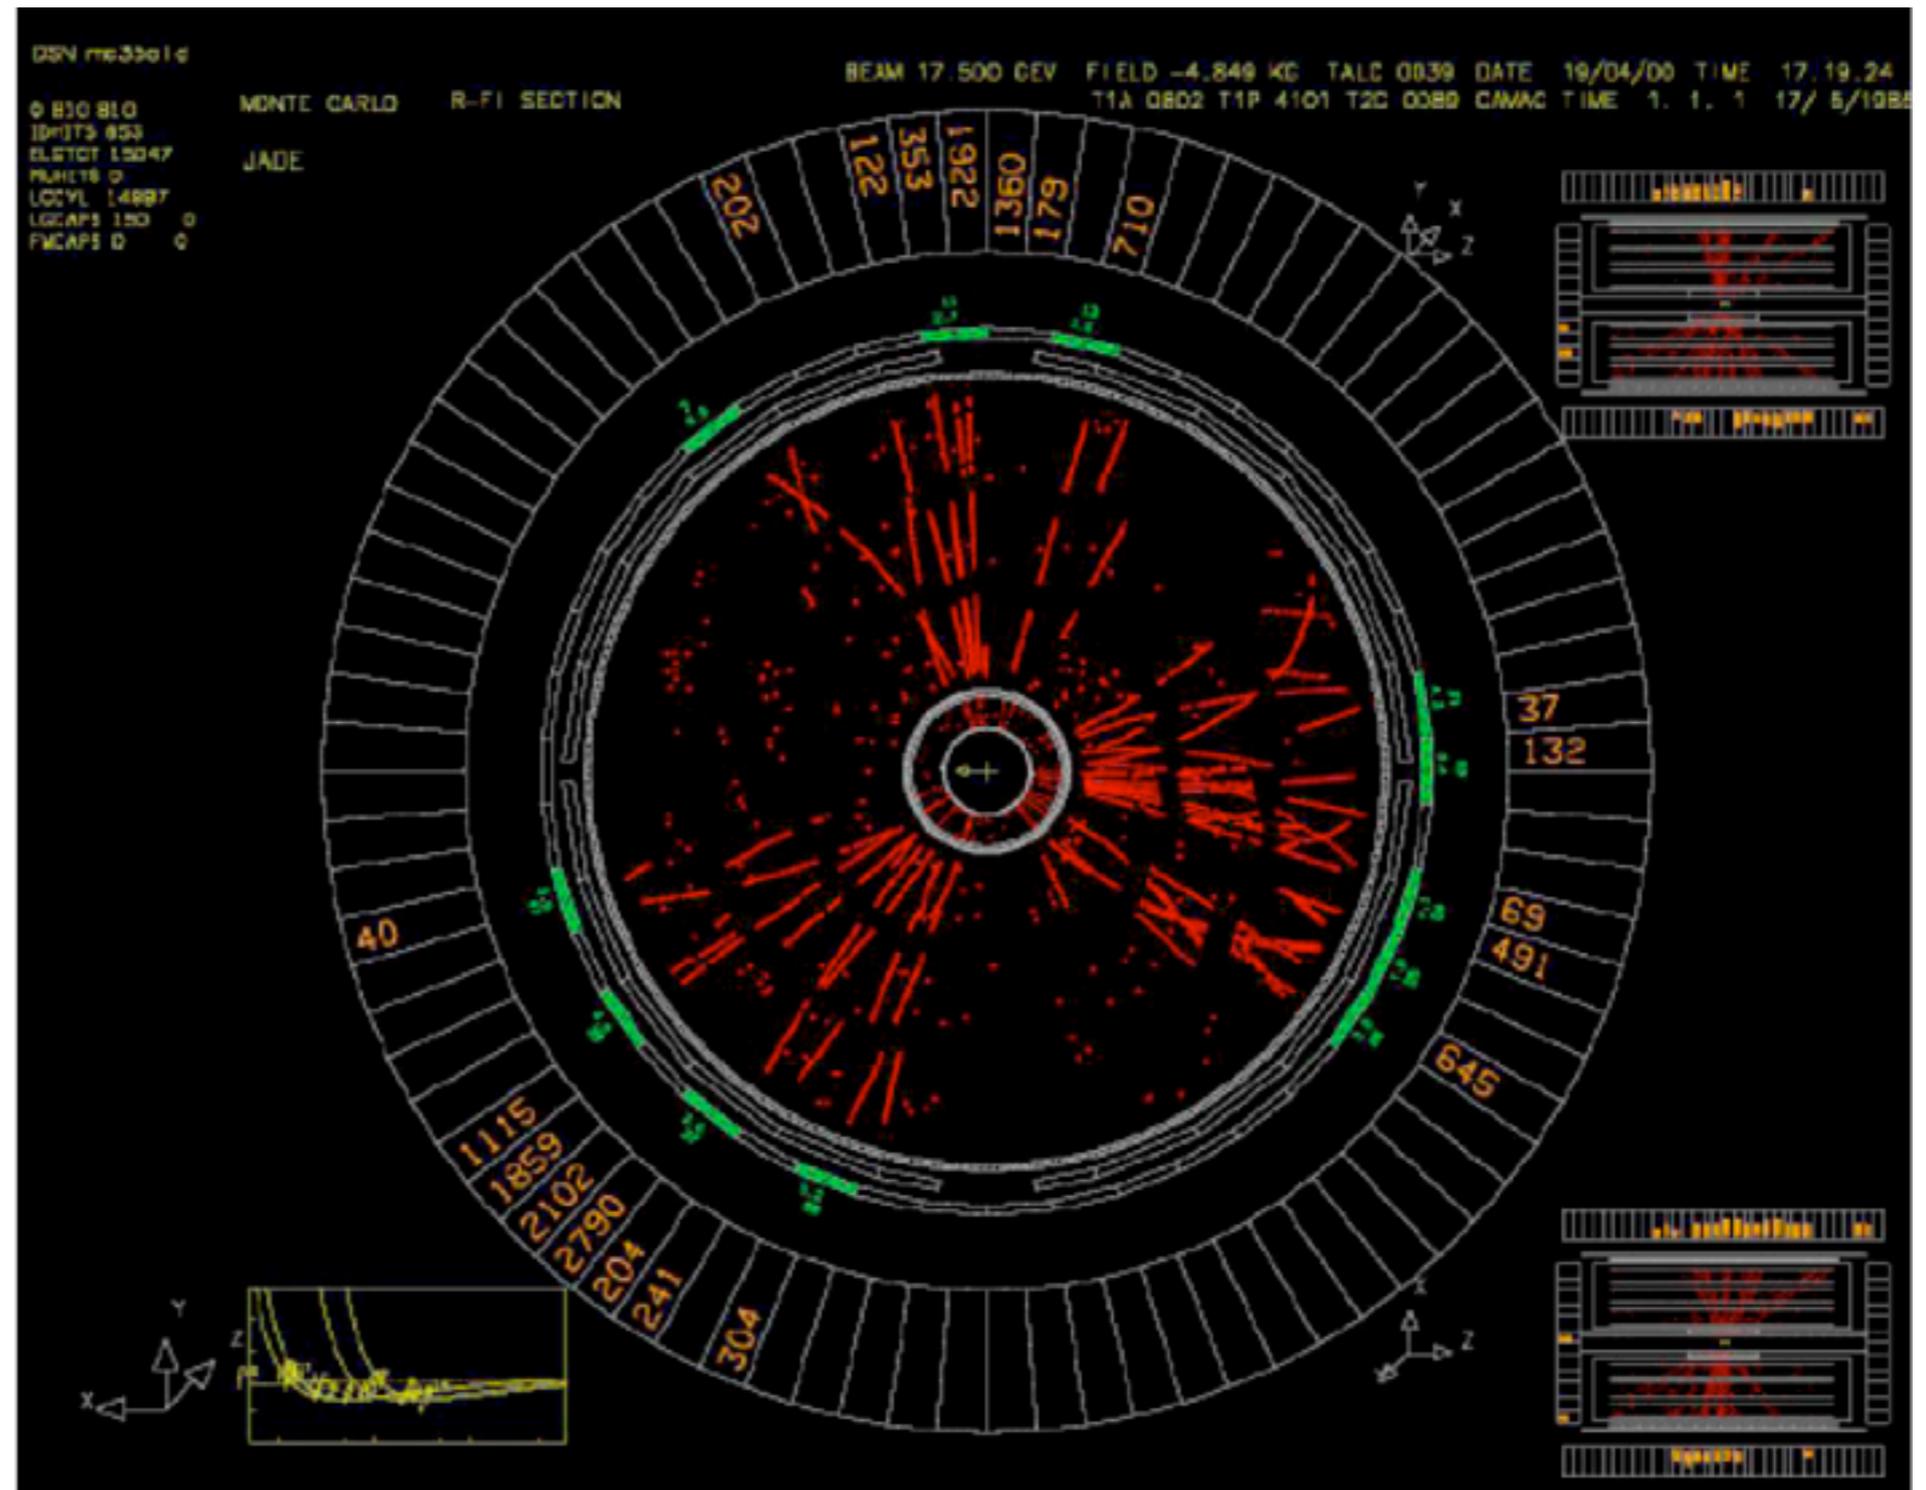

Recall the intro on
colour:

Observation of
its higher order
process,

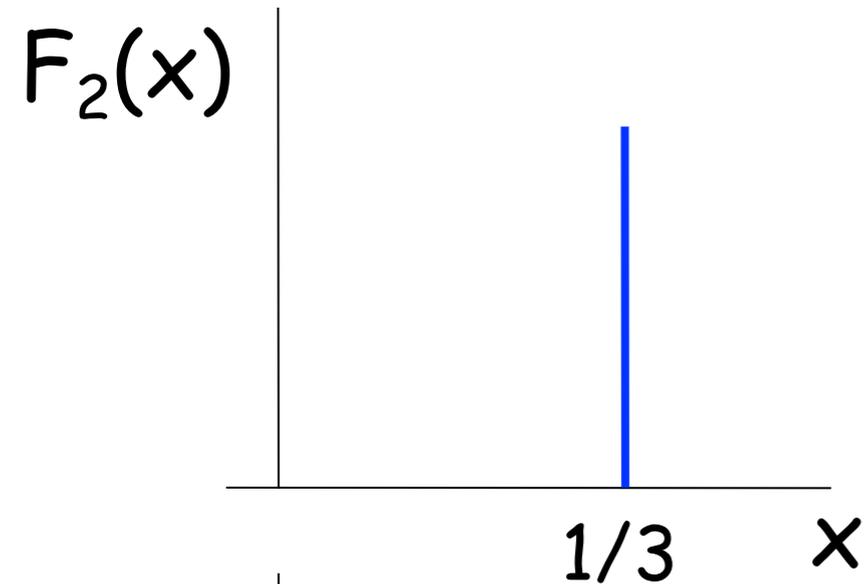

marks the discovery
of the gluon.

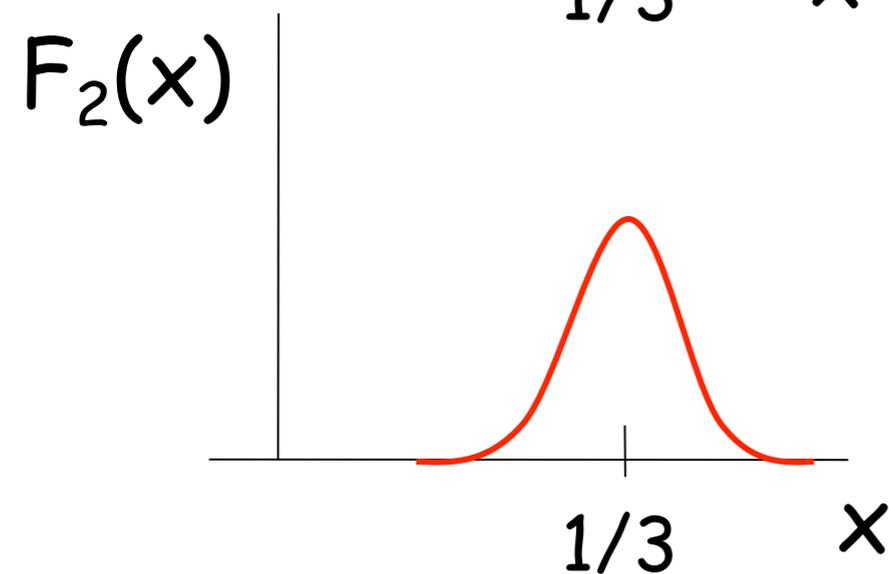

Mom. Conservation: *Gluons carry the other half of the nucleon momentum.*

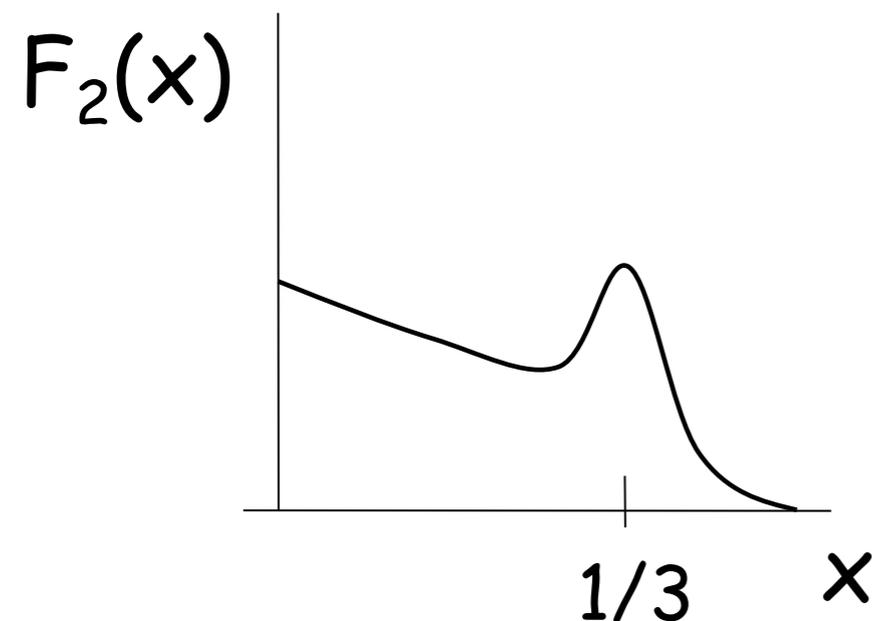

Nucleon Structure

Three quarks with $1/3$ of total proton momentum each.

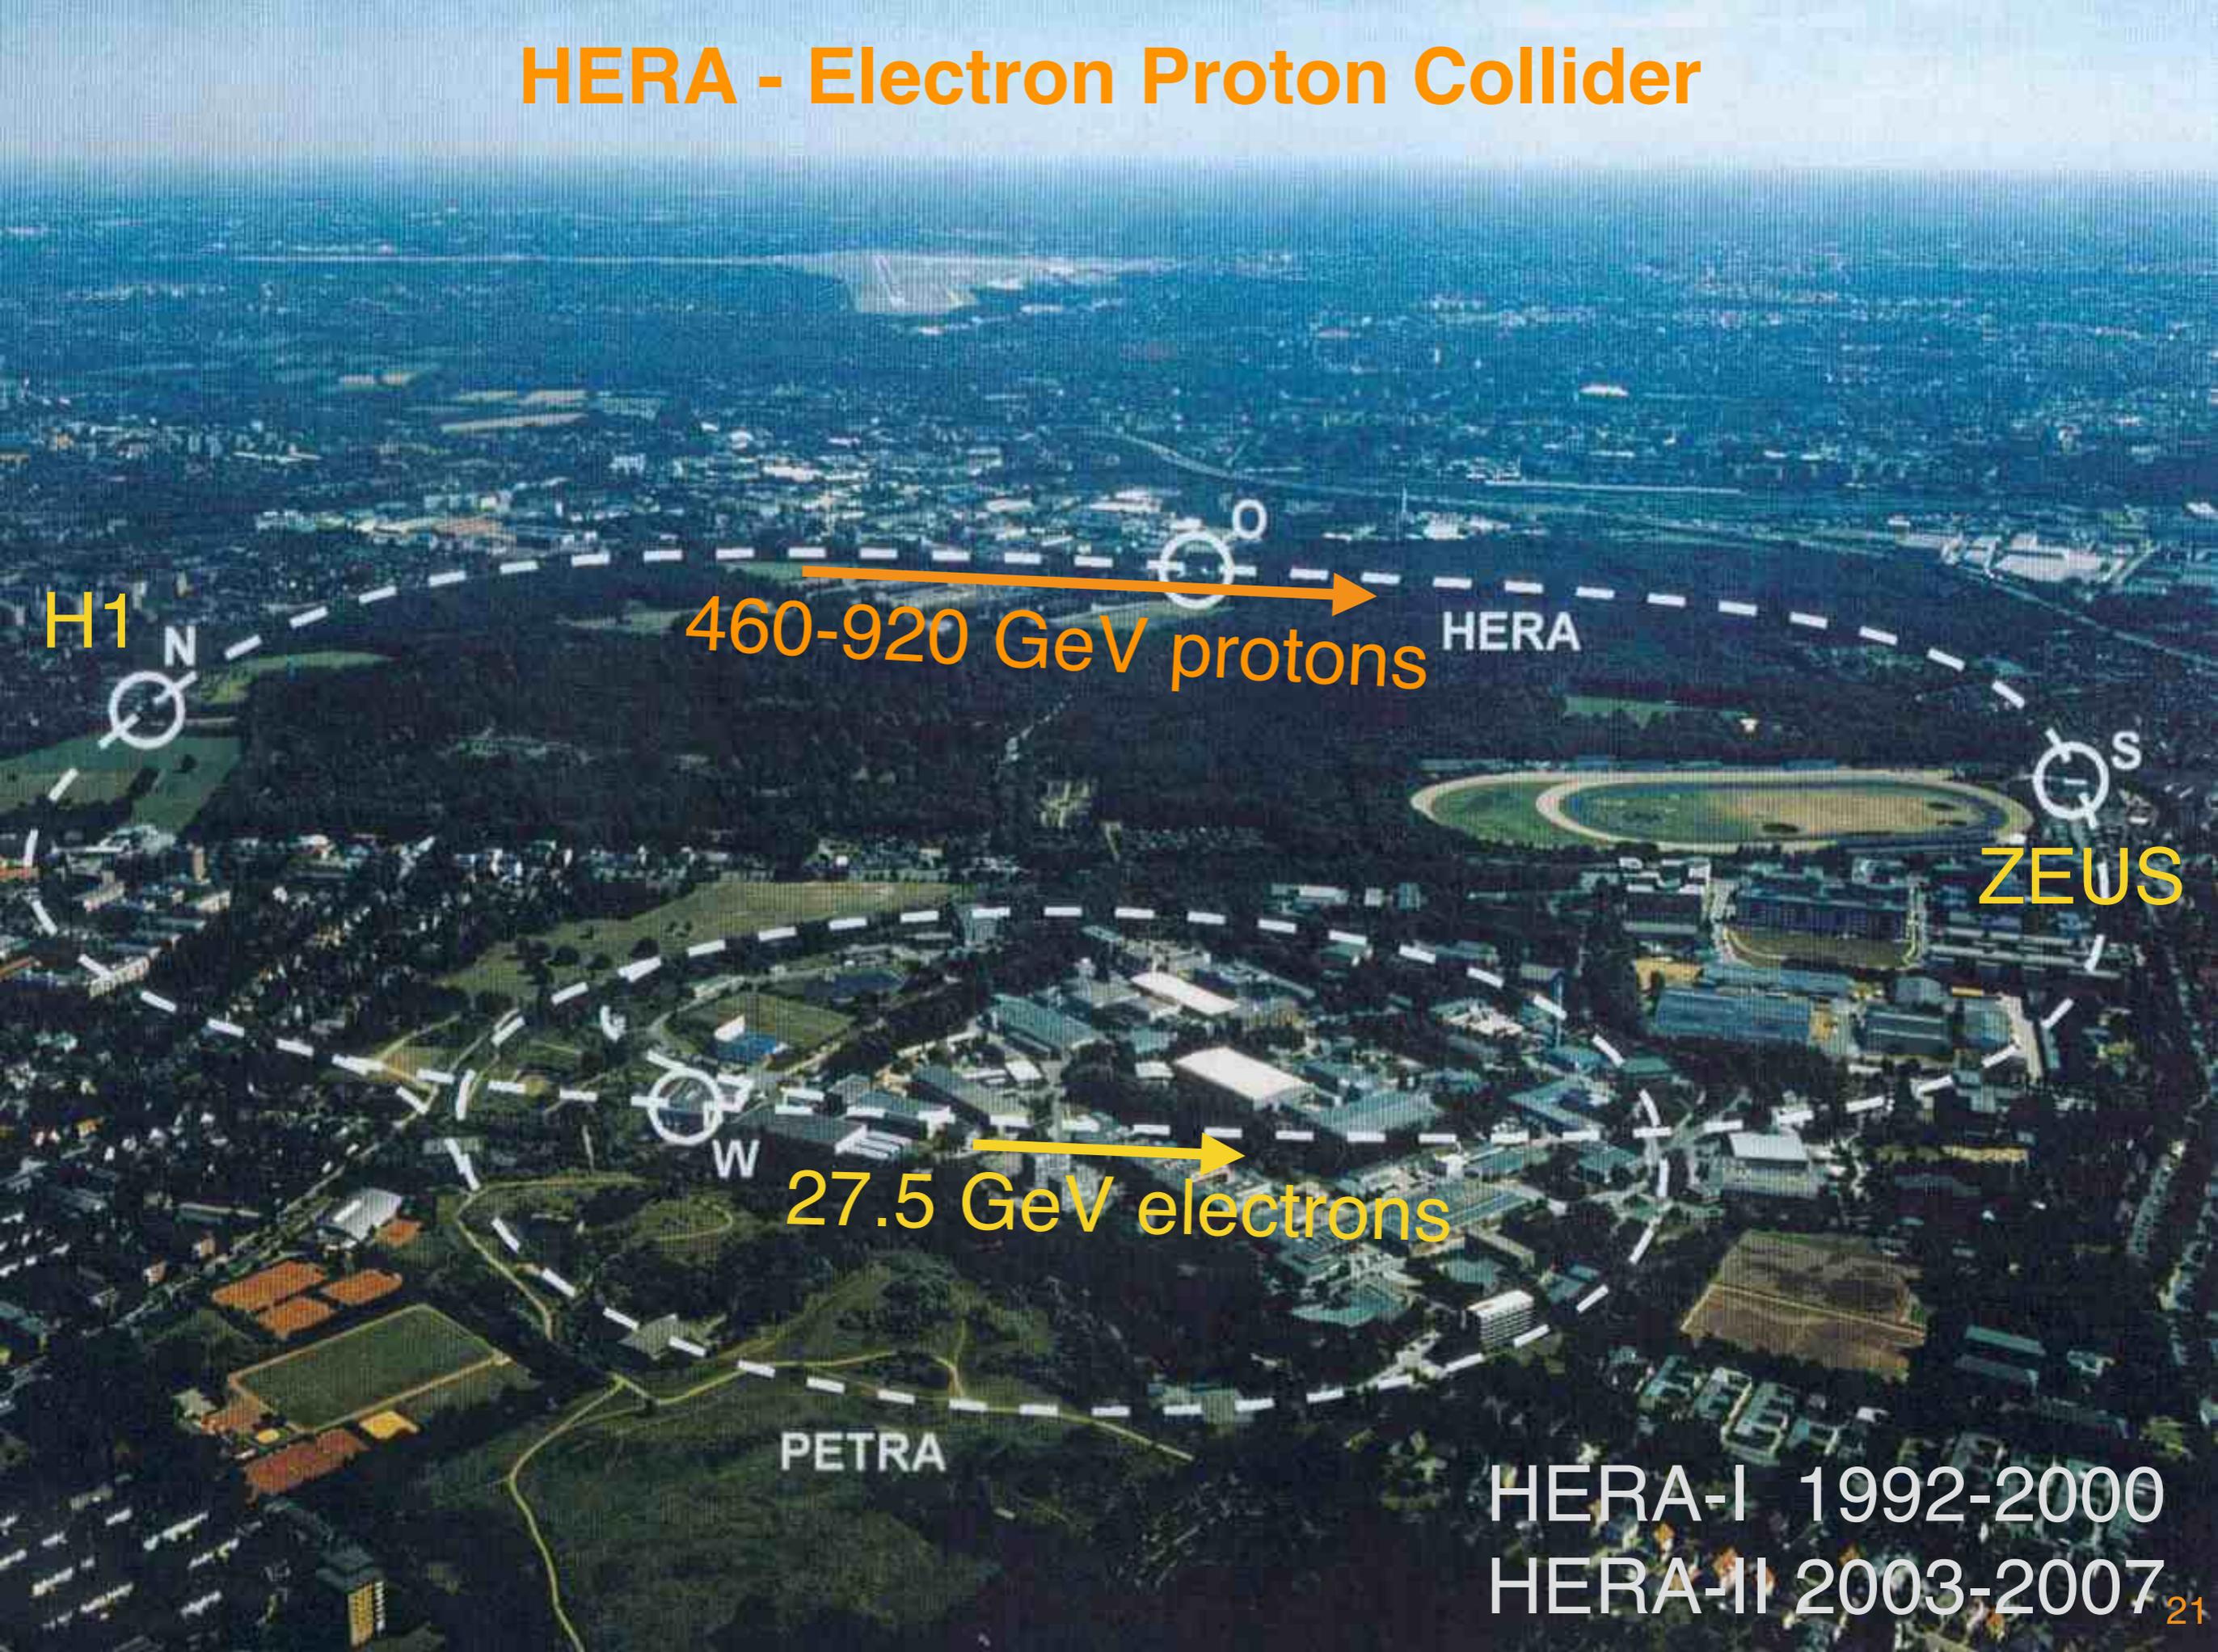

Three quarks with some momentum smearing.

The three quarks radiate partons to lower momentum fractions x .

Insight really only from the first EIC, HERA

HERA - Electron Proton Collider

H1

460-920 GeV protons

HERA

ZEUS

27.5 GeV electrons

PETRA

HERA-I 1992-2000
HERA-II 2003-2007

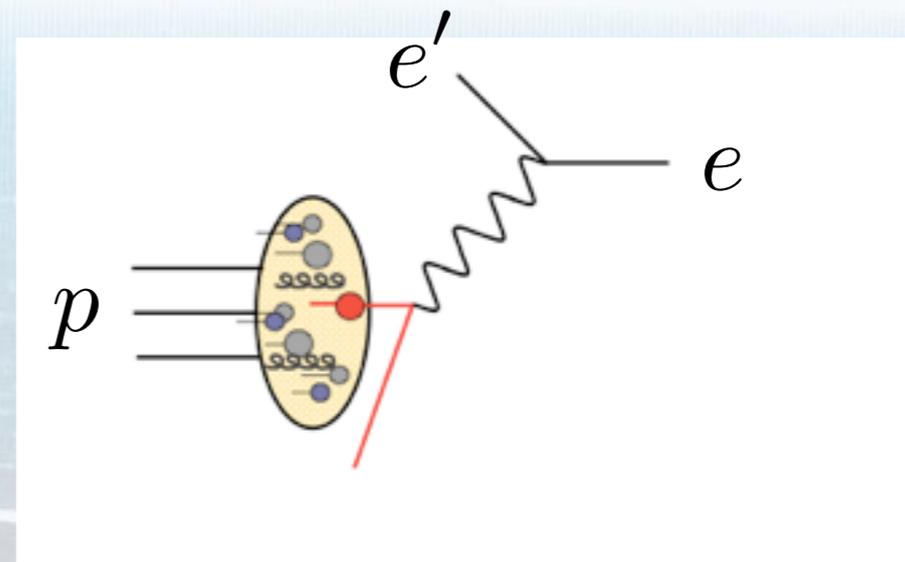

HERA - Electron Proton Collider

Observed (or known):

$$e = (0, 0, -E_e, E_e)$$

$$e' = (E'_e \sin \theta'_e, 0, E'_e \cos \theta'_e, E_e)$$

$$p = (0, 0, E_p, E_p)$$

i.e. angles are defined *w.r.t. the hadron beam direction* (HERA-convention).

Relevant invariants:

$$s = (e + p)^2$$

Square of total c.m. energy

$$q = e - e' \quad Q^2 = -(e - e')^2$$

Square of (4-)momentum transfer

$$x = \frac{Q^2}{ys}$$

Bjorken-x, ~parton mom. fraction

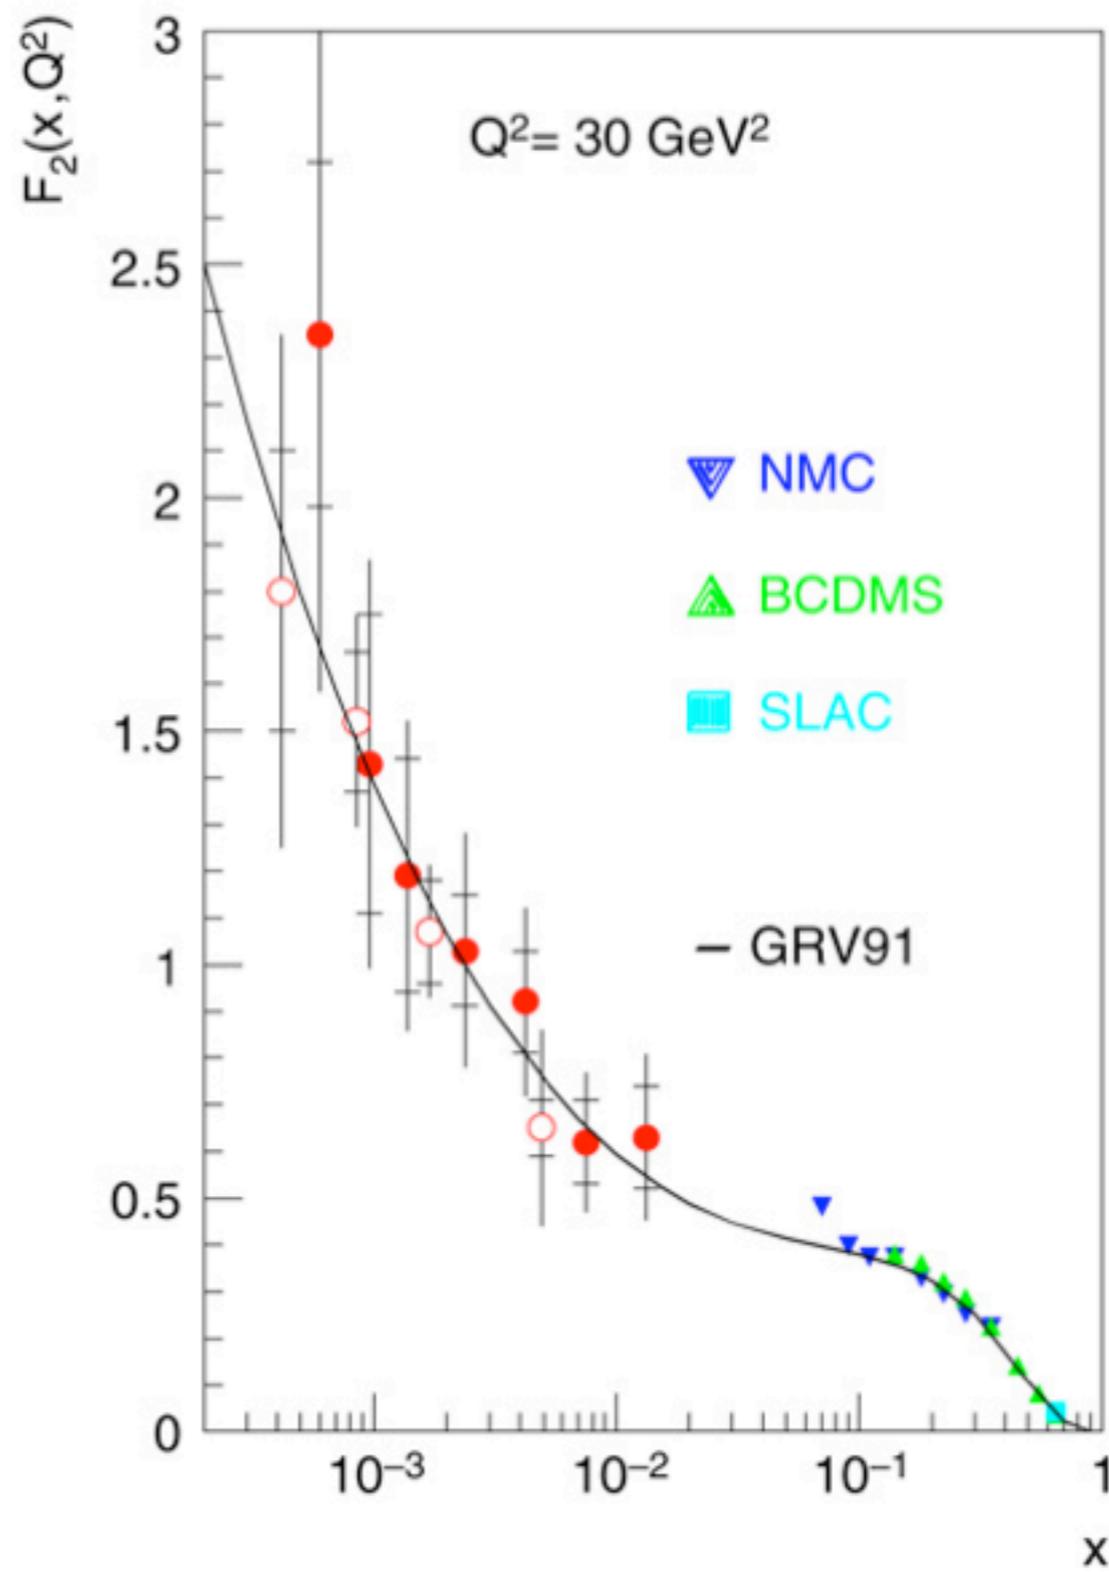

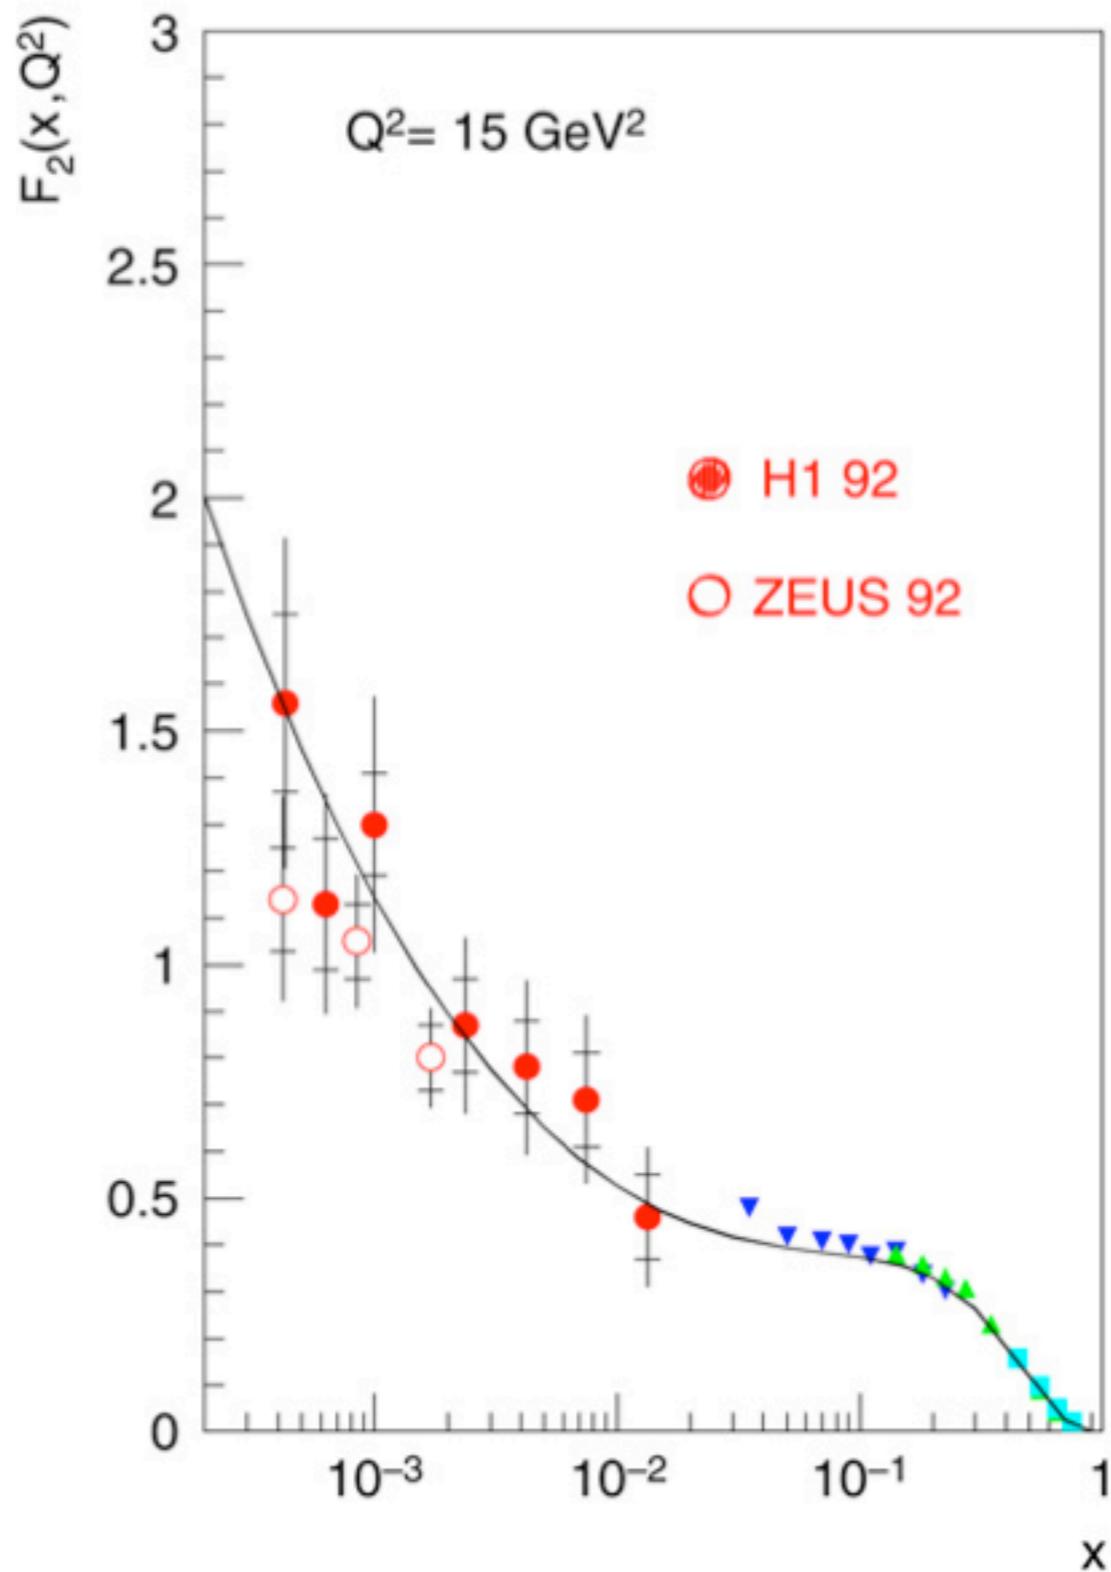

$$y = (q.p)/(e.p)$$

Fractional energy transfer

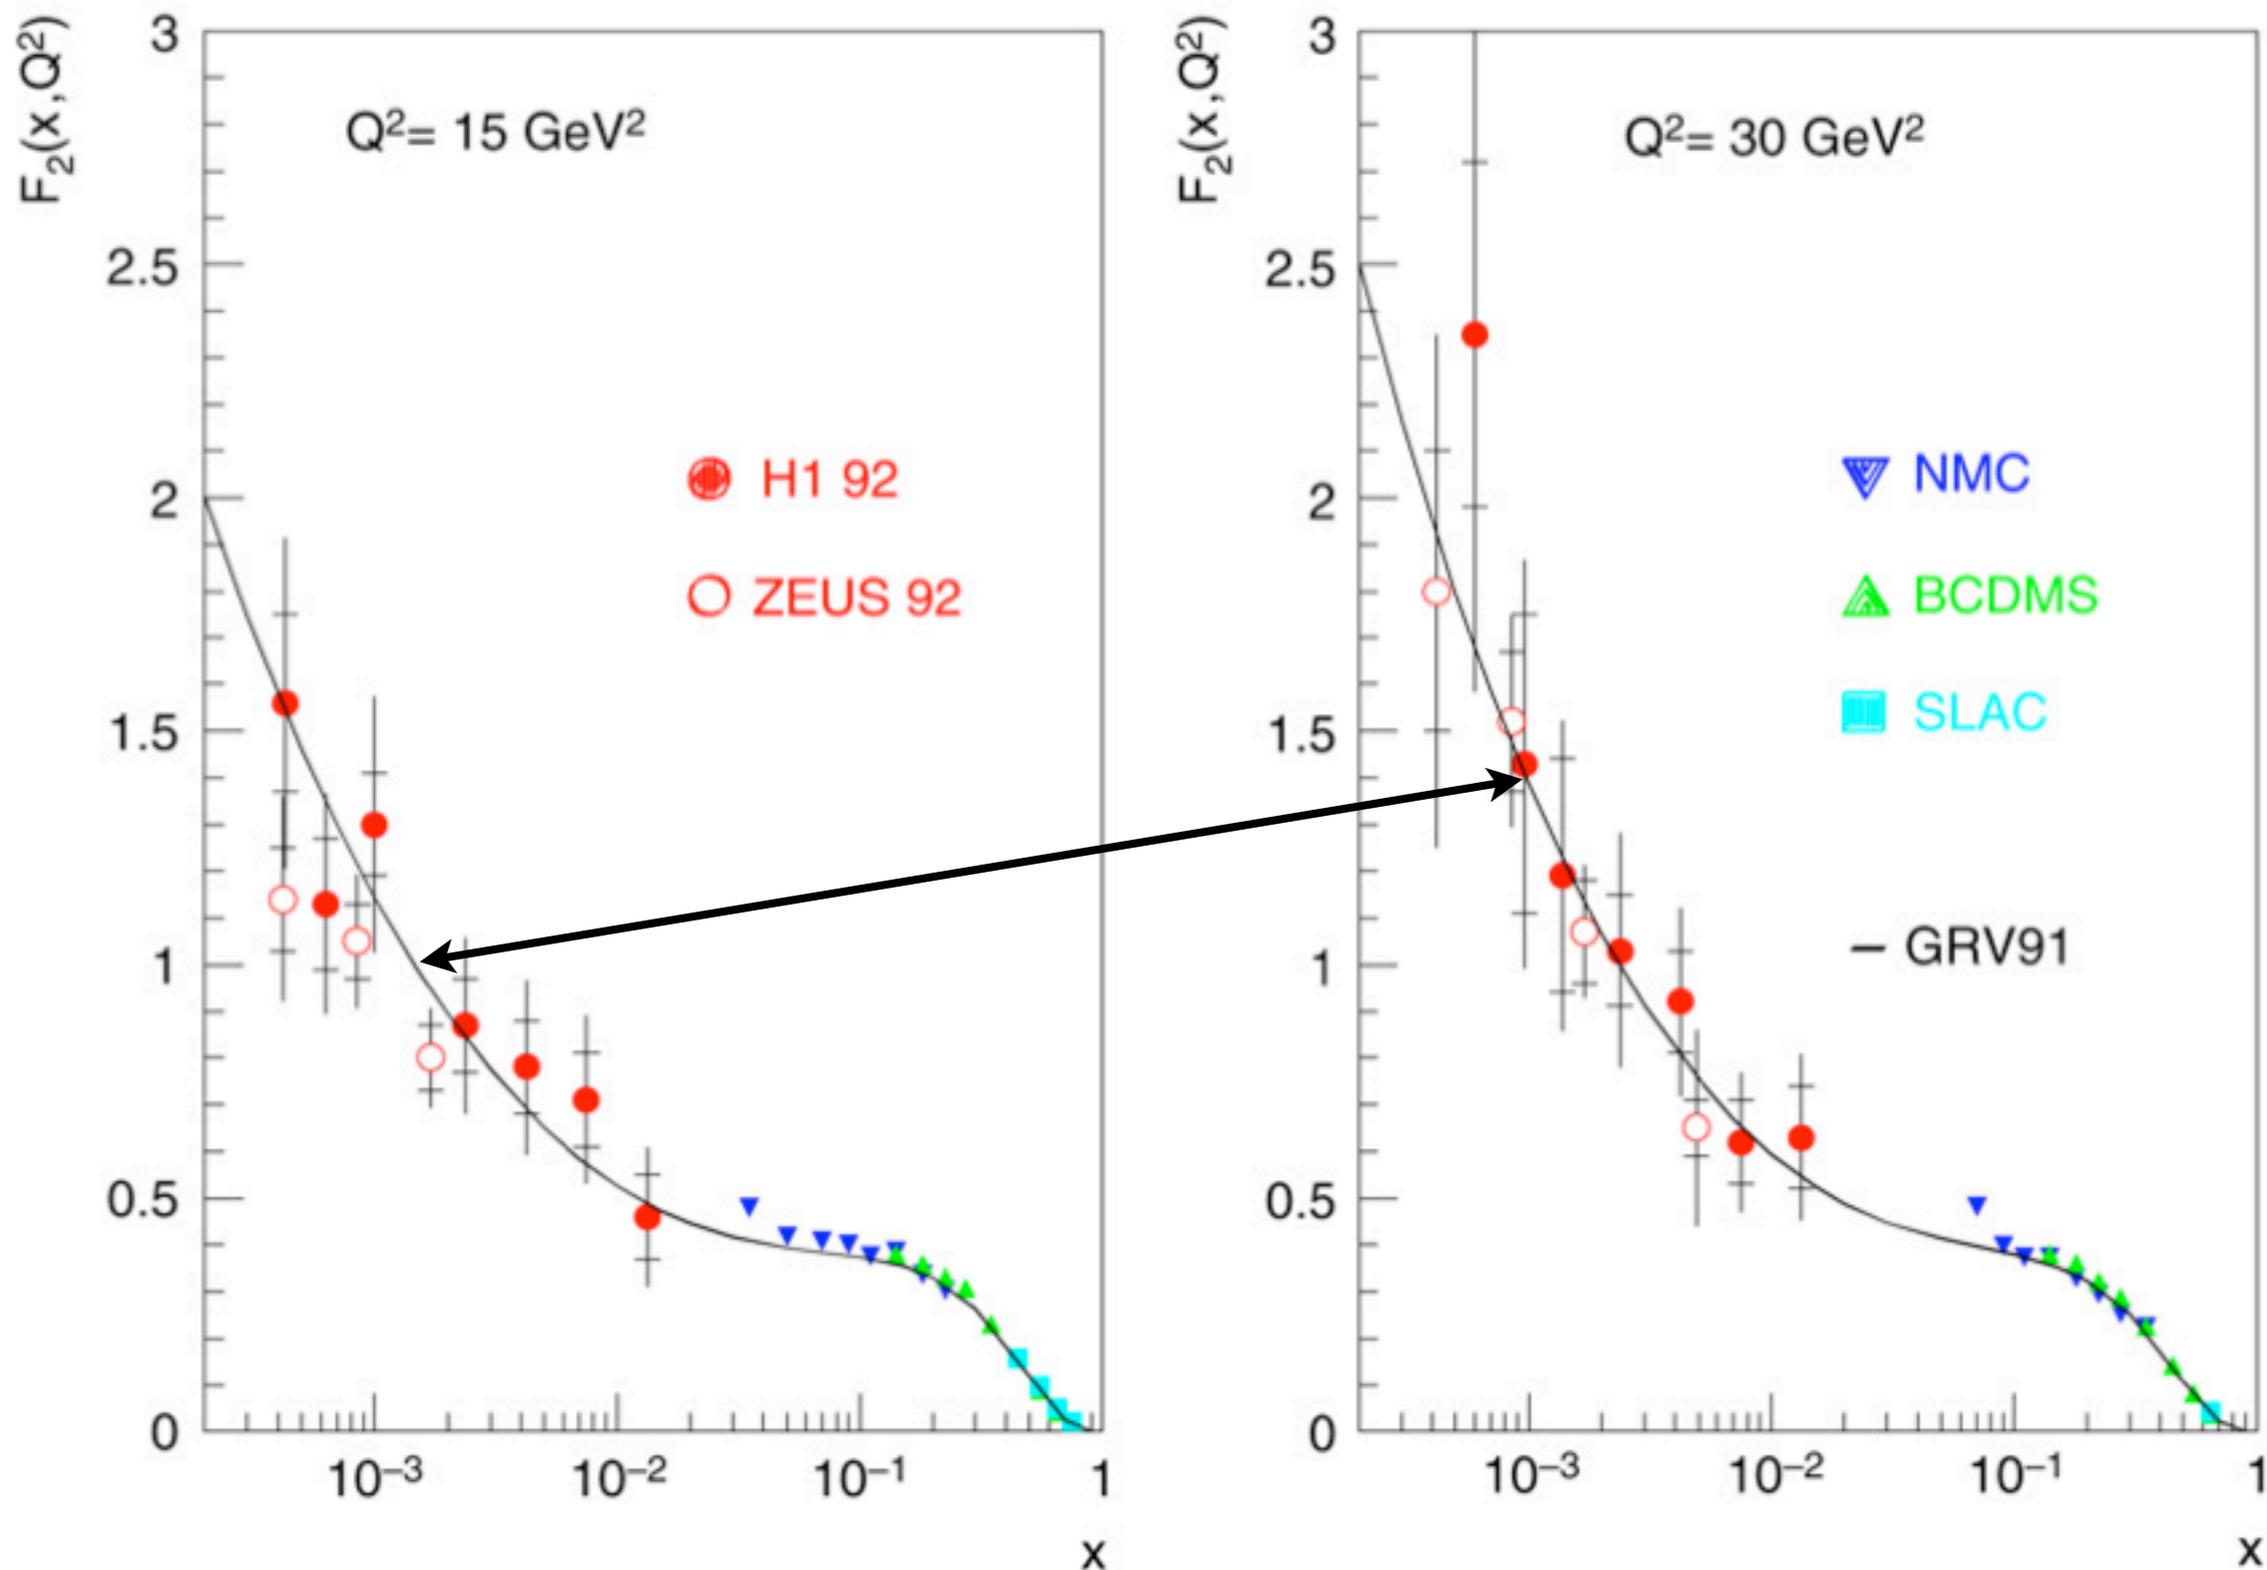

x, Q^2 can be reconstructed from the scattered electron, the “current jet”, or hybrids.

HERA-I 1992-2000
HERA-II 2003-2007

HERA - Early Measurements

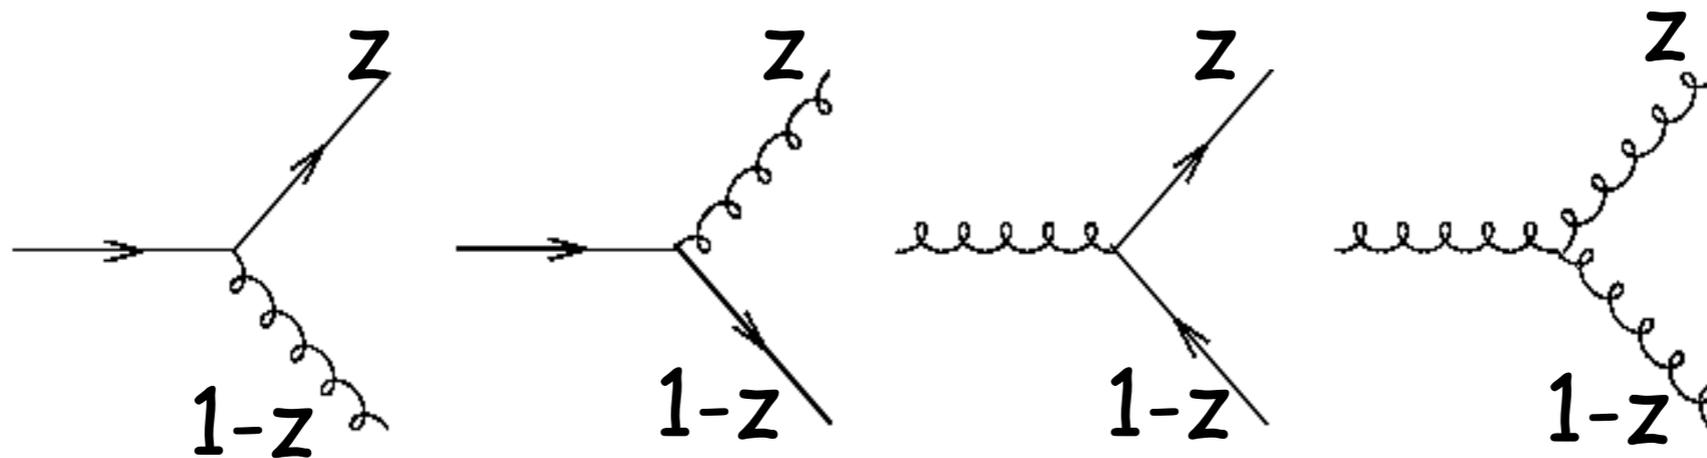

HERA - Early Measurements

Can these observations be related?

QCD Radiation

DGLAP equations are easy to “understand” intuitively, in terms of four “splitting functions”,

$P_{ab}(z)$: the probability that parton **a** will radiate a parton **b** with the fraction z of the original momentum carried by **a**.

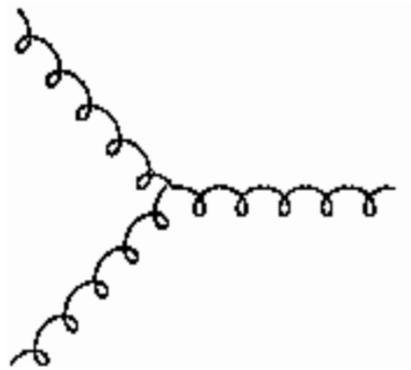

Yu.L. Dokshitzer, Sov.Phys. JETP **46** (1977) 641,

V.N. Gribov and L.N.Lipatov, Sov. Journ. Nucl. Phys. **15** (1972) 438; *ibid* **15** (1972) 675

G.Altarelli and G.Parisi, Nucl.Phys. **B126** (1977) 298

QCD Radiation

DGLAP is highly successful, but not the only approach.

Gluons do not recombine,
incoherence is preserved.

Gluon-dense environments?

Similarly, process-independent quarks, survive.

How does DGLAP work?

QCD Radiation

Schematically, DGLAP equations:

$$\frac{dq_f(x, Q^2)}{d \ln Q^2} = \alpha_s [q_f \otimes P_{qq} + g \otimes P_{gq}]$$

convolution

strong coupling constant

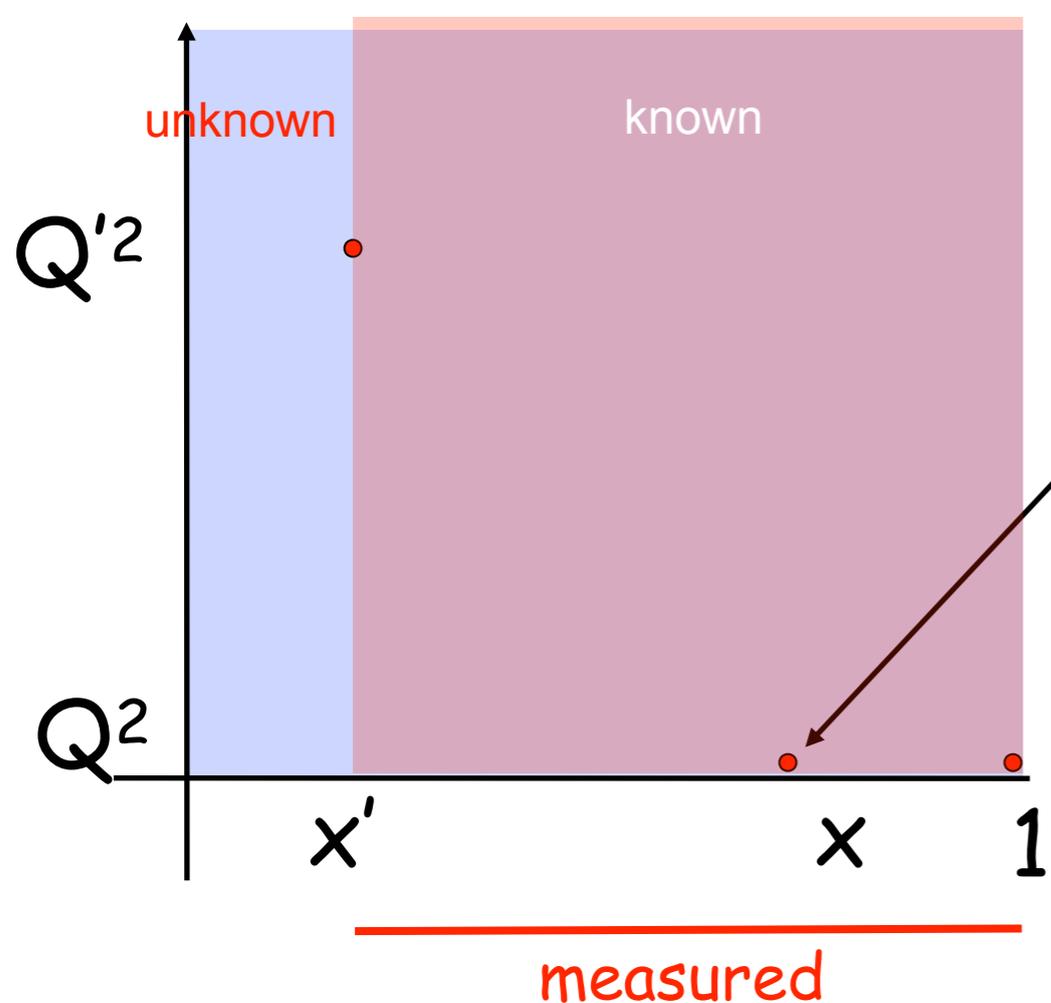

That is, the change of quark distribution q with Q^2 is given by the probability that q and g radiate q .

Similarly, for gluons:

$$\frac{dg(x, Q^2)}{d \ln Q^2} = \alpha_s [\sum q_f \otimes P_{qg} + g \otimes P_{gg}]$$

QCD Radiation

A parton at x at Q^2 is a source of partons at $x' < x$ at $Q'^2 > Q^2$.

Any parton at $x > x'$ at Q^2 is a source.

It is necessary and sufficient to know the parton densities in the range $x' \leq x \leq 1$ at a lower Q^2 to determine the parton density at x', Q'^2 .

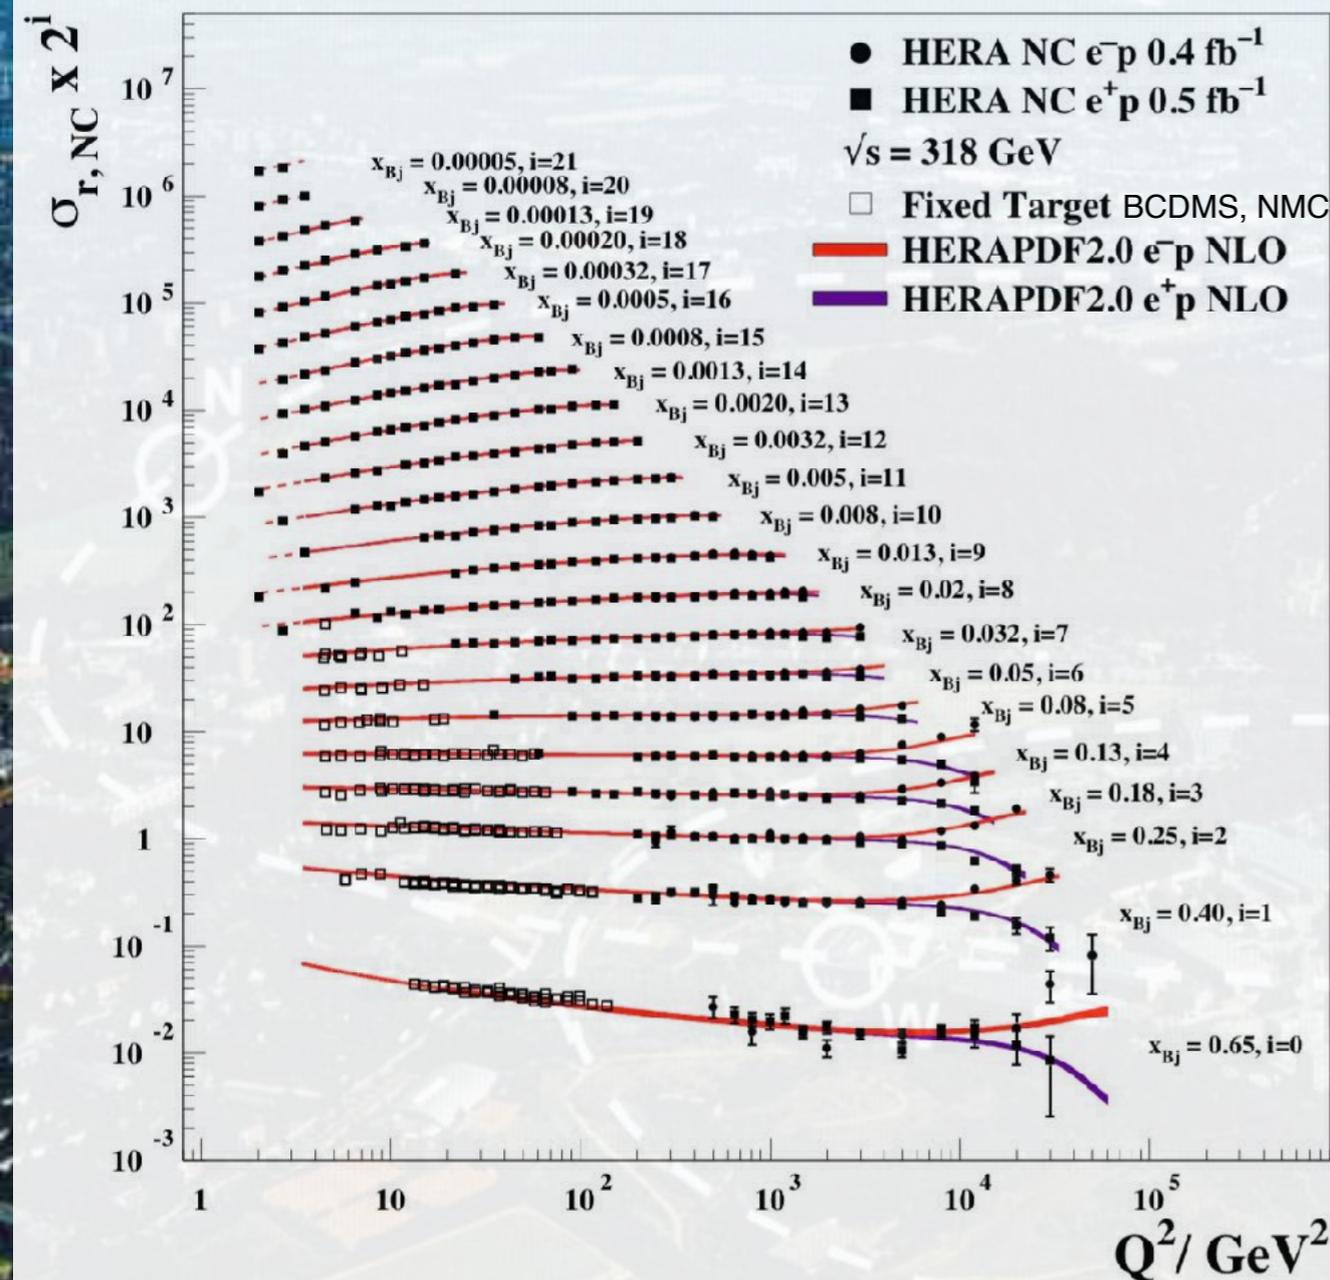

If you measure partons in range $x' \leq x \leq 1$ at some Q^2 then you know them in that range, and only that range, for all Q'^2 .

Asymptotic solutions exist to the DGLAP equations that may overwhelm the intrinsic contributions.

HERA's Legacy

H1 and ZEUS Coll., EPJ C75 (2015) 580

H1 and ZEUS

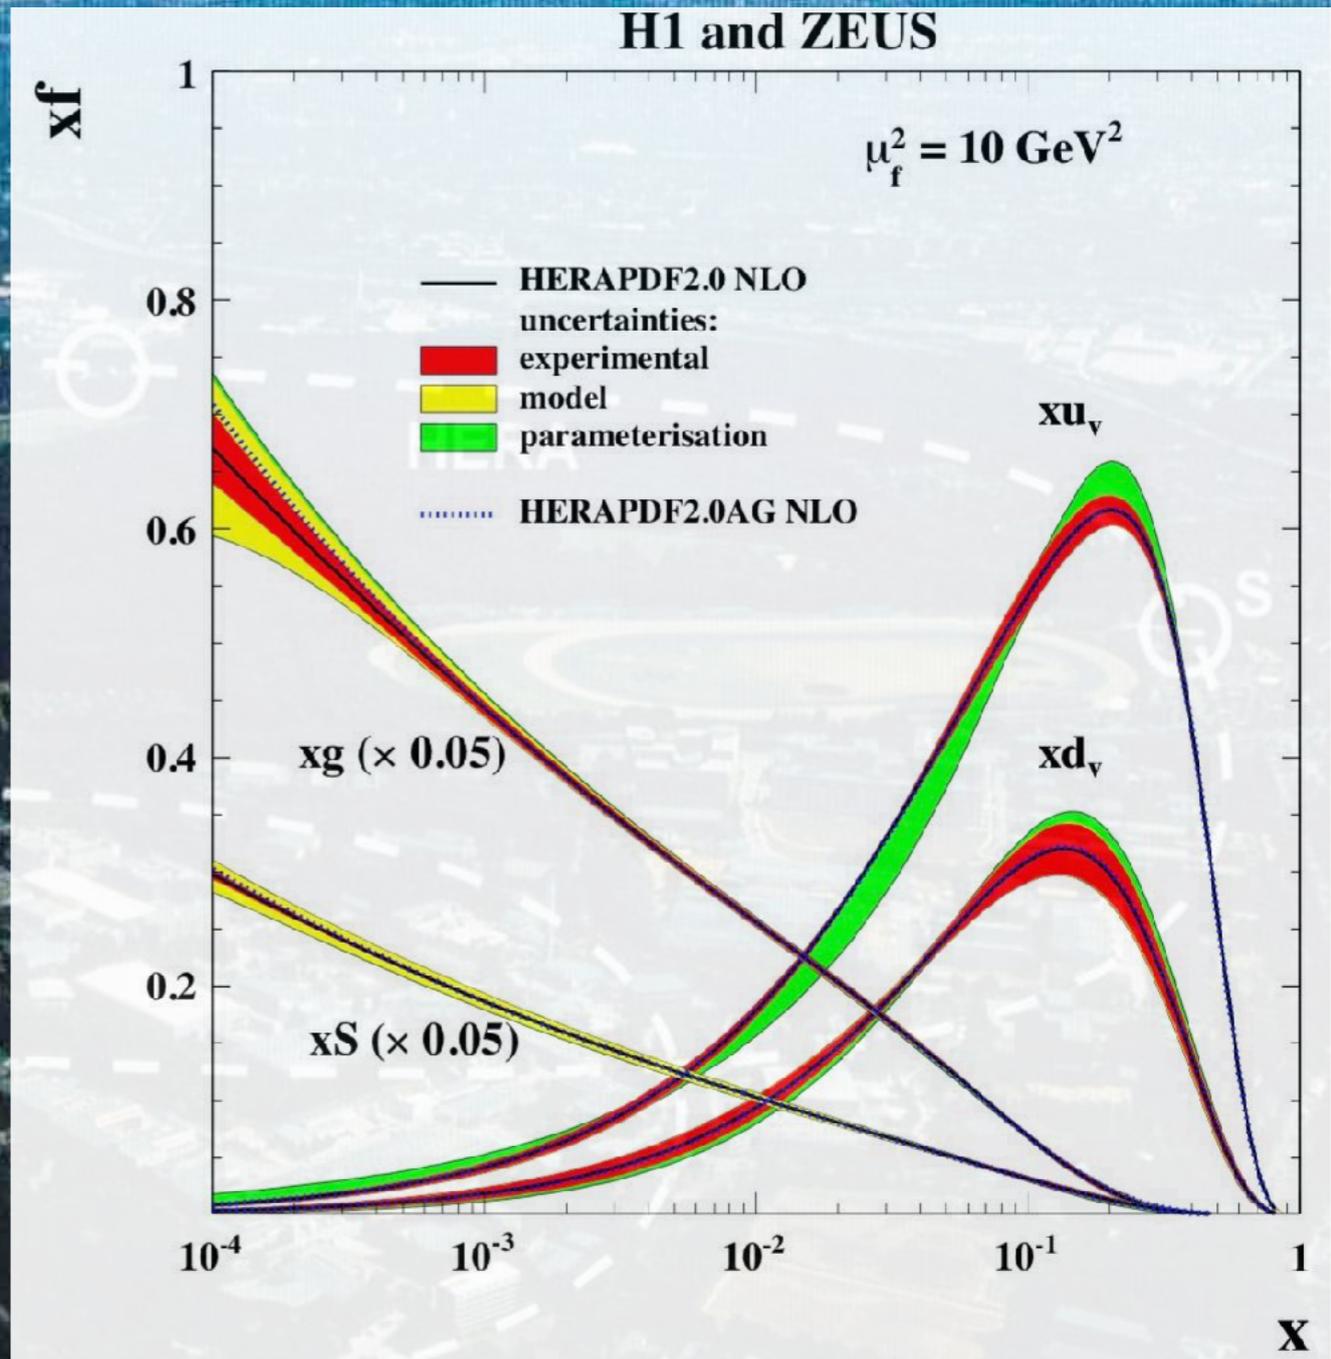

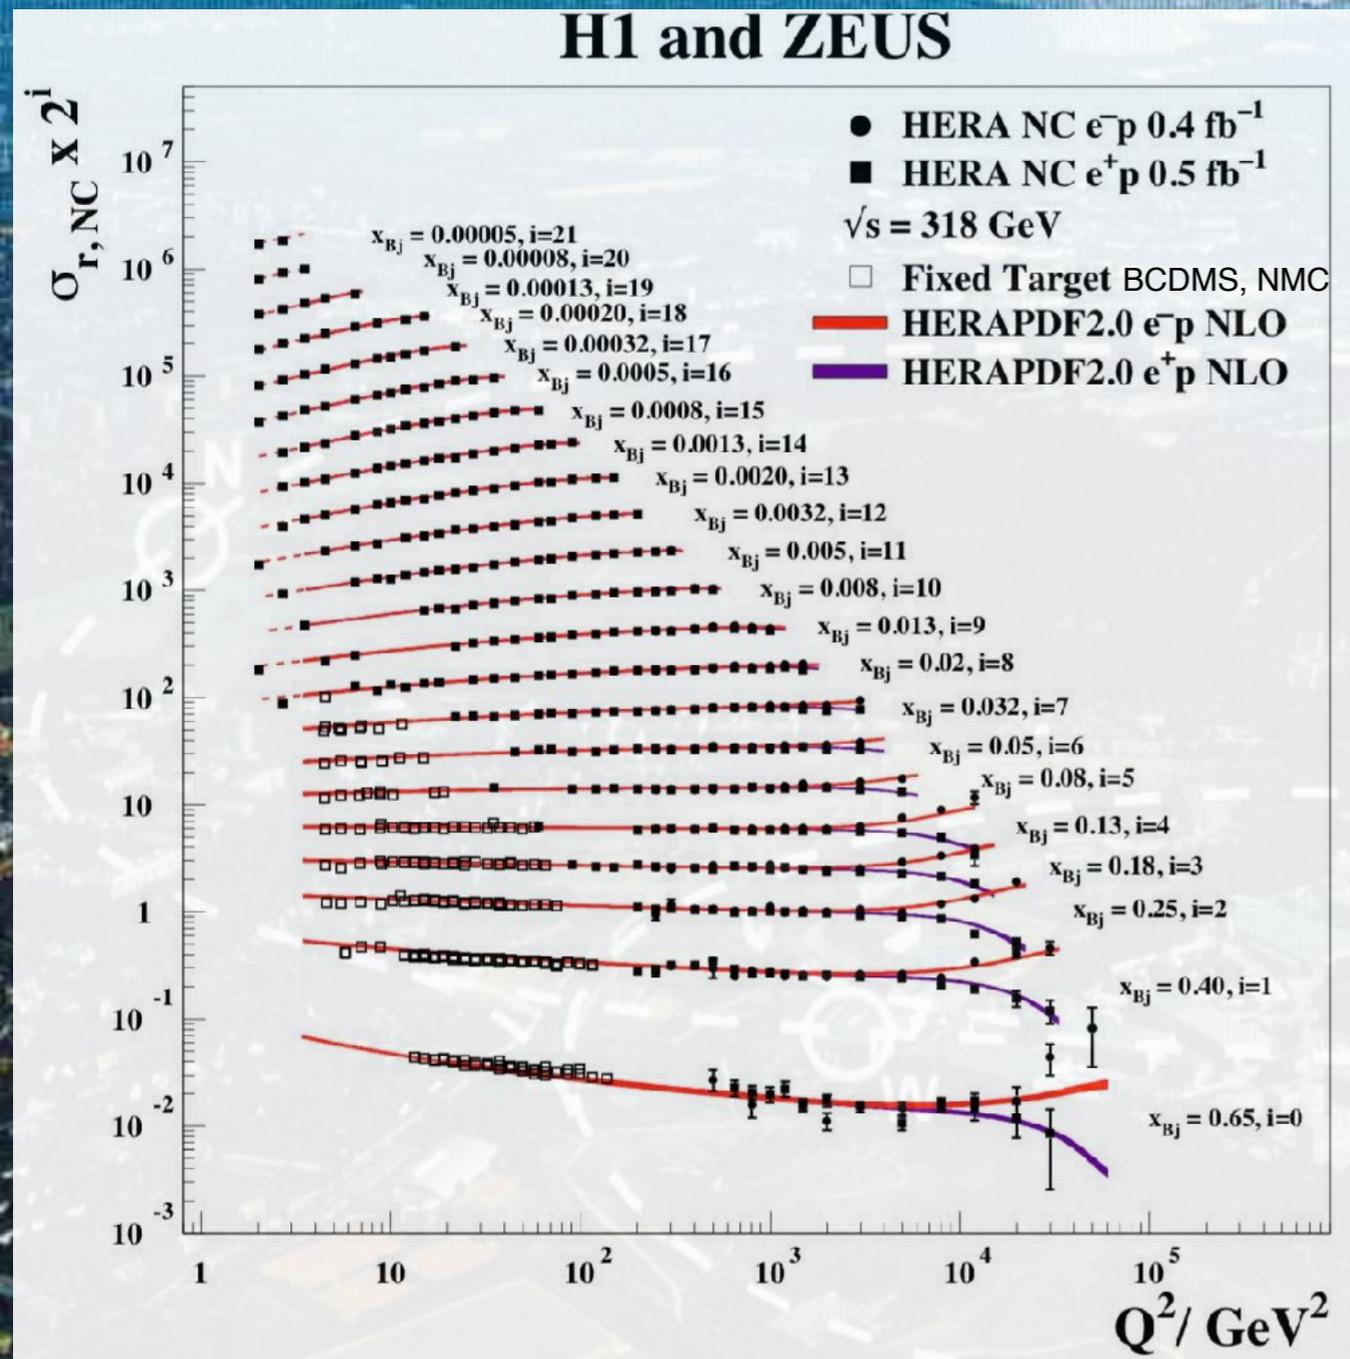

A lot in this plot:

- covers about five orders of magnitude in x and Q^2 ,
- consistency of fixed-target data and HERA data,
- scaling at $x \sim 0.1$ and violations elsewhere,
- strong rise of gluon density,
- E.W. interference at high Q^2 ,
- crucial input to “PDF fits”

PETRA

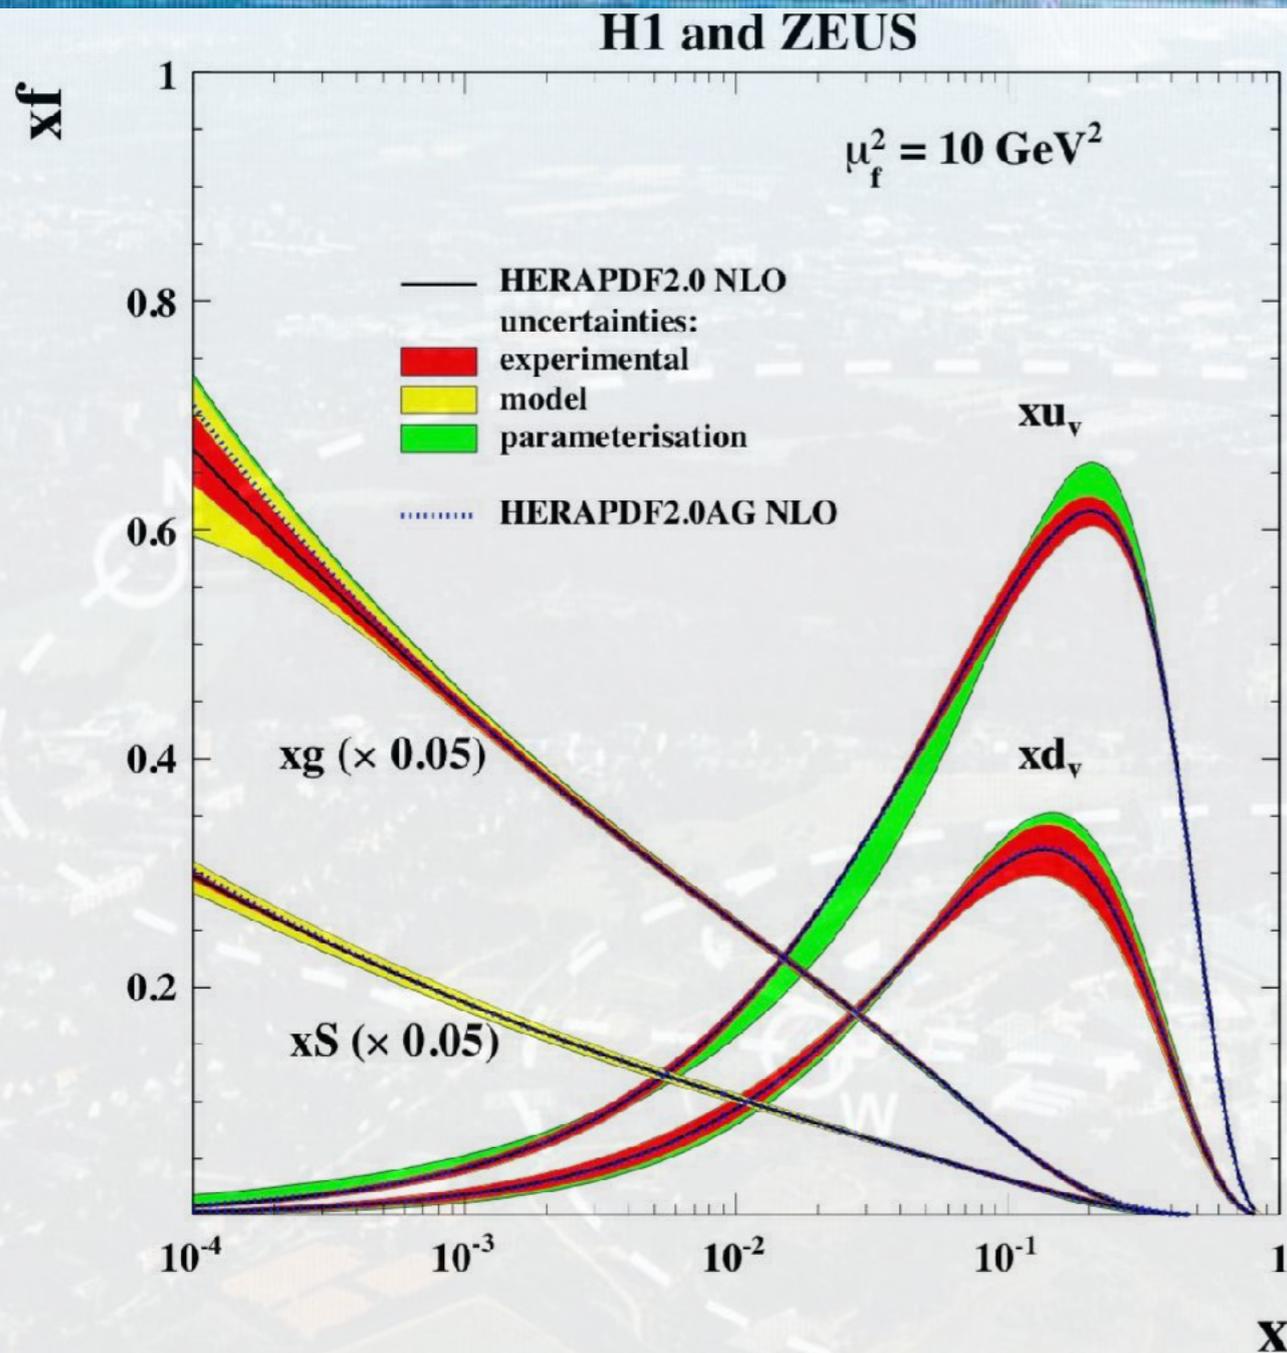

HERA's Legacy

H1 and ZEUS Coll., EPJ C75 (2015) 580

Vast body of *precision* measurements over a wide kinematic range,
 Exquisite insight in high-energy proton structure and QCD dynamics.

HERA's Legacy

Proton structure at high-energy is:

- *far* from elementary,
- gluon-dominated for $x < 0.1$,

Gluon content increases with decreasing x ,

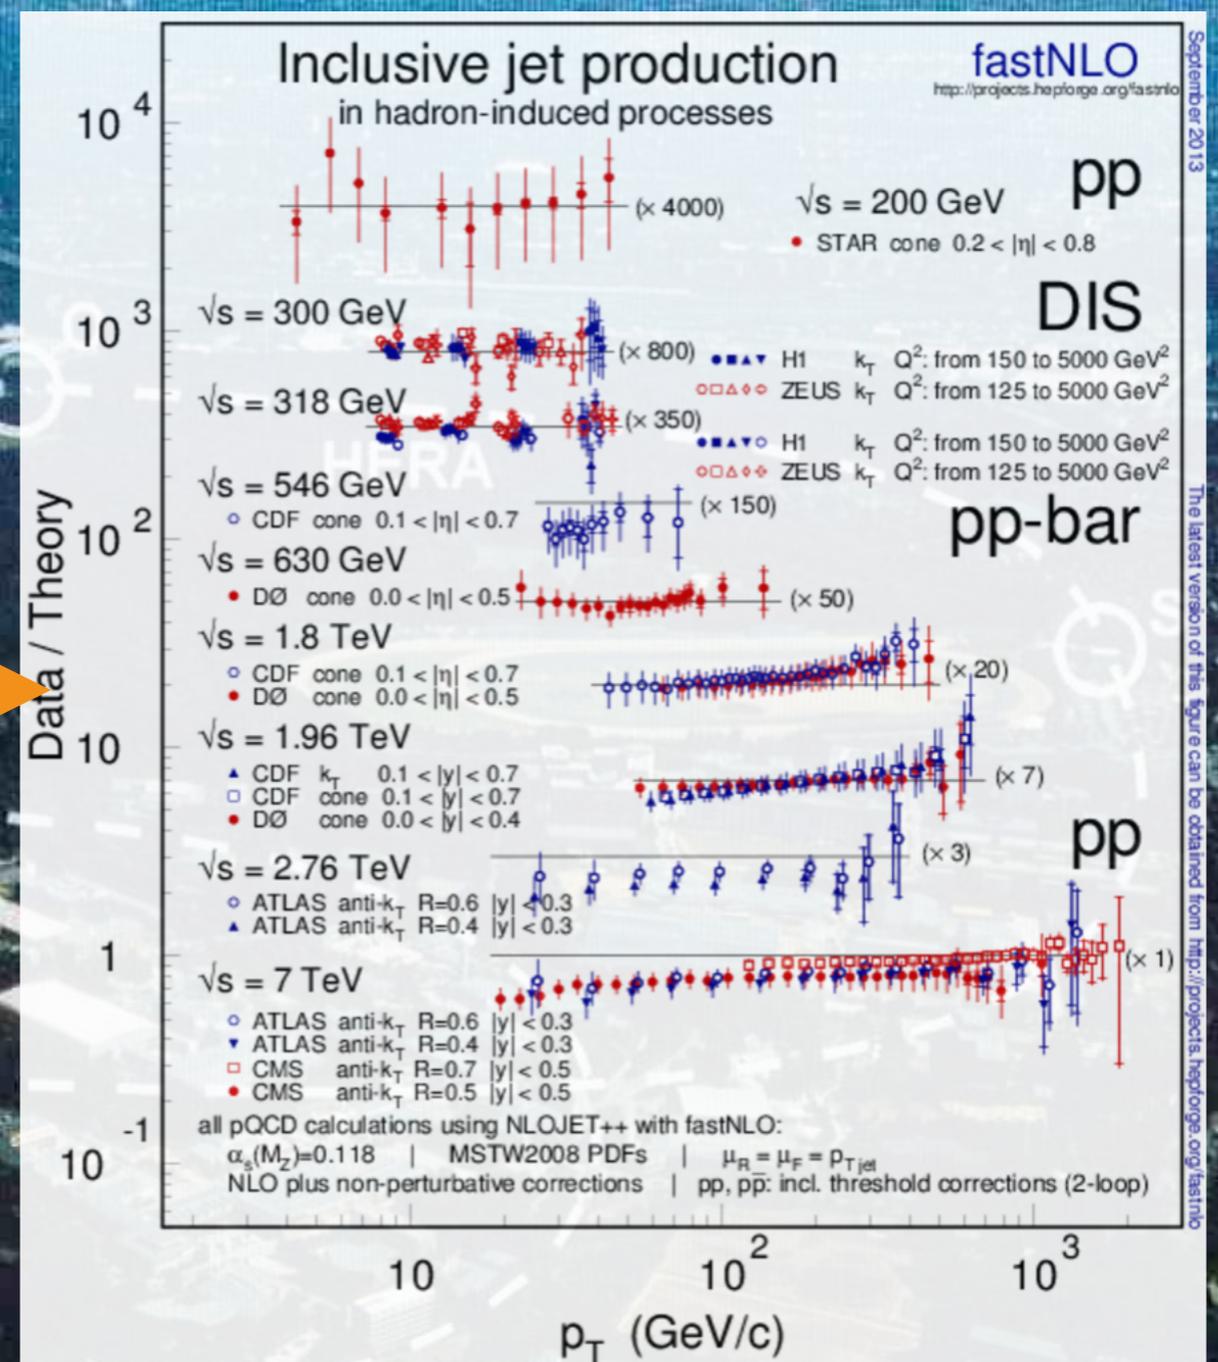

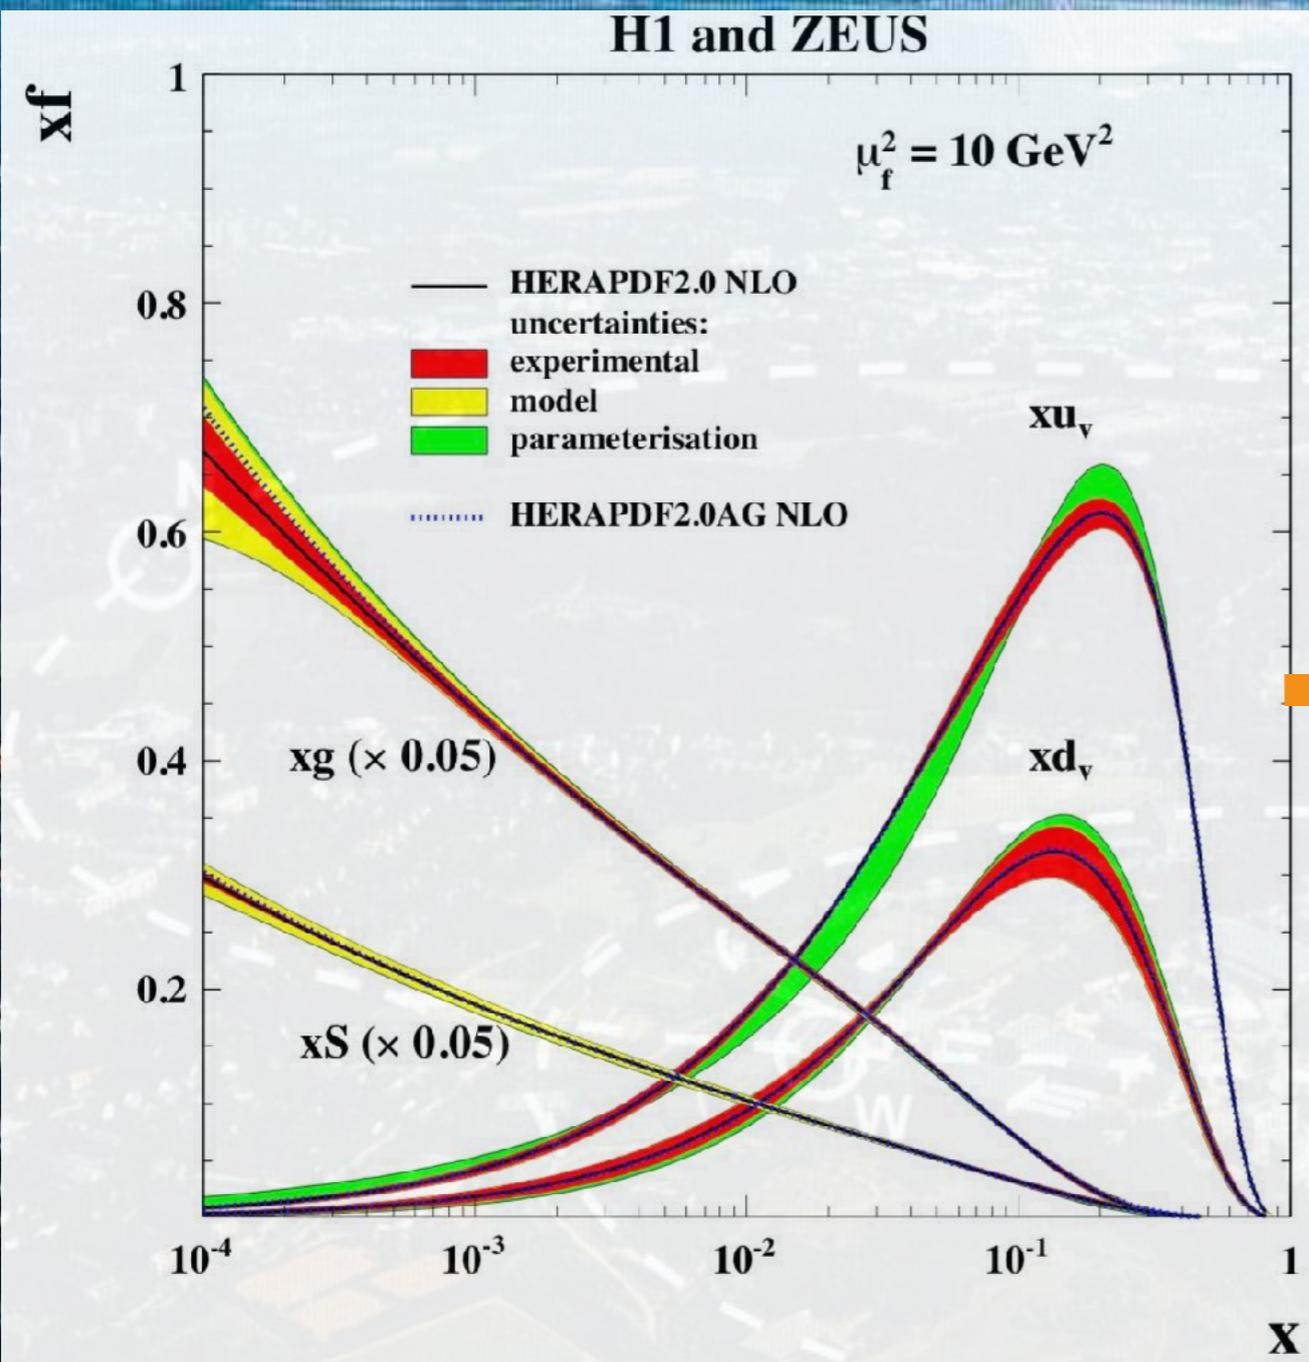

Gluons pose a number of questions

HERAPDF2.0:

- 14 parameters,
- ~ 1400 combined data points,

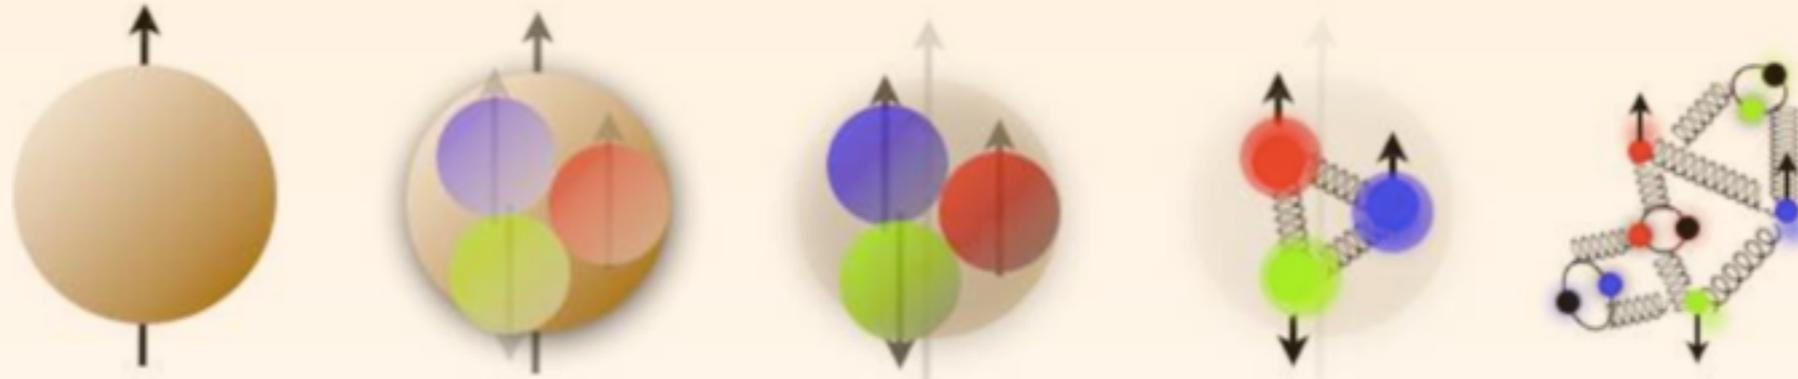

Vast body of *precision* measurements over a wide kinematic range,
Exquisite insight in high-energy proton structure and QCD dynamics.

HERA's Legacy

Factorization, the separation of short distance and long distance physics, combined with PDFs are 'universally invaluable' in hard scattering processes.

What *is* a proton, neutron, nucleus?

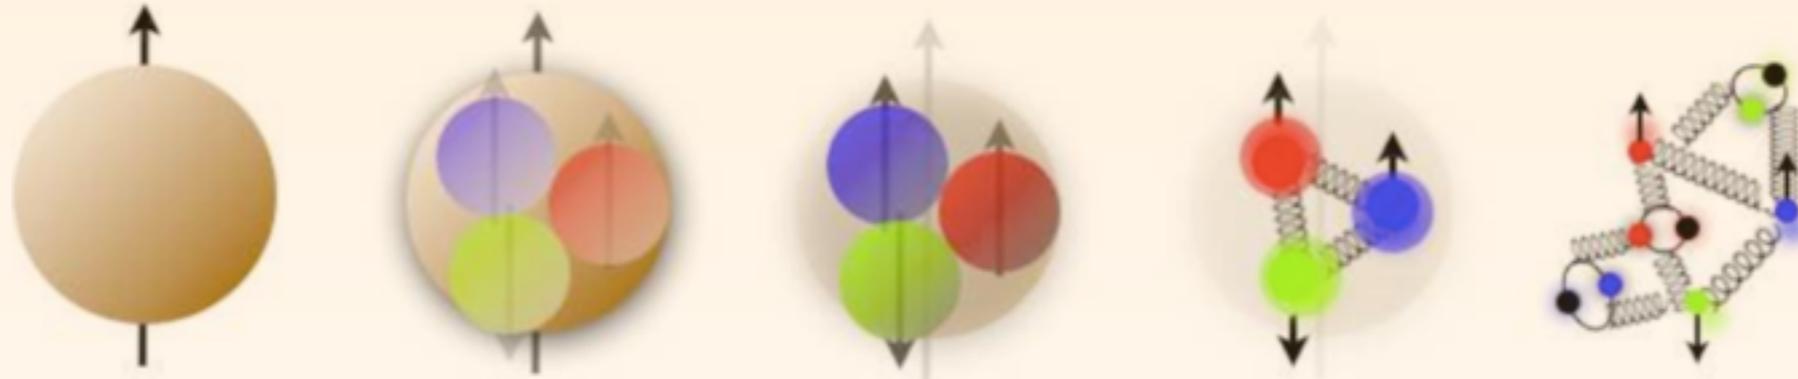

At high energy: an unseparated, broadband beam of quarks, anti-quarks, and gauge bosons (primarily gluons), and perhaps other constituents, yet unknown.

*40 years of an amazingly robust idealization:
Renormalization group-improved Parton Model*

*Factorization theorem(s) + one-dimensional parton distributions,
no correlations among the partons*

What *is* a proton, neutron, nucleus?

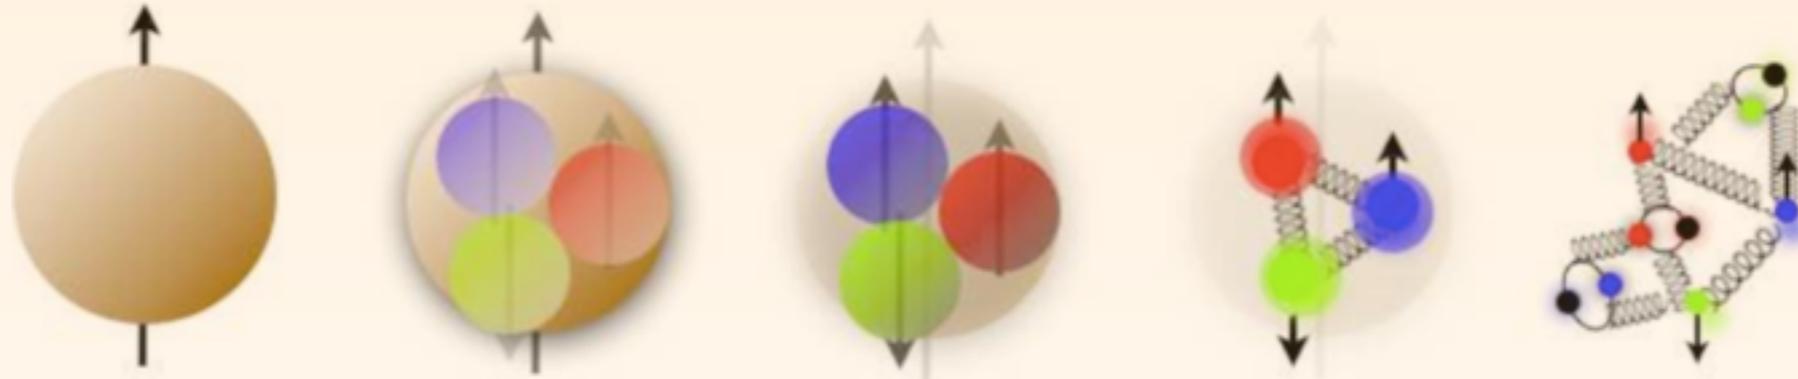

At high energy: an unseparated, broadband beam of quarks, anti-quarks, and gauge bosons (primarily gluons), and perhaps other constituents, yet unknown.

*40 years of an amazingly robust idealization:
Renormalization group-improved Parton Model*

*Factorization theorem(s) + one-dimensional parton distributions,
no correlations among the partons*

***Not quite.... more than a few high-energy observations are actually different
QCD is the richest part of the Standard Model Gauge Field Theory and
will (have to) be developed much further, on its own and as backgrnd.***

See also Rept.Prog.Phys. 82 (2019) 024301

U.S.-based EIC - Two Facility Concepts

eRHIC:

- re-use existing RHIC hadron beam,

JLEIC:

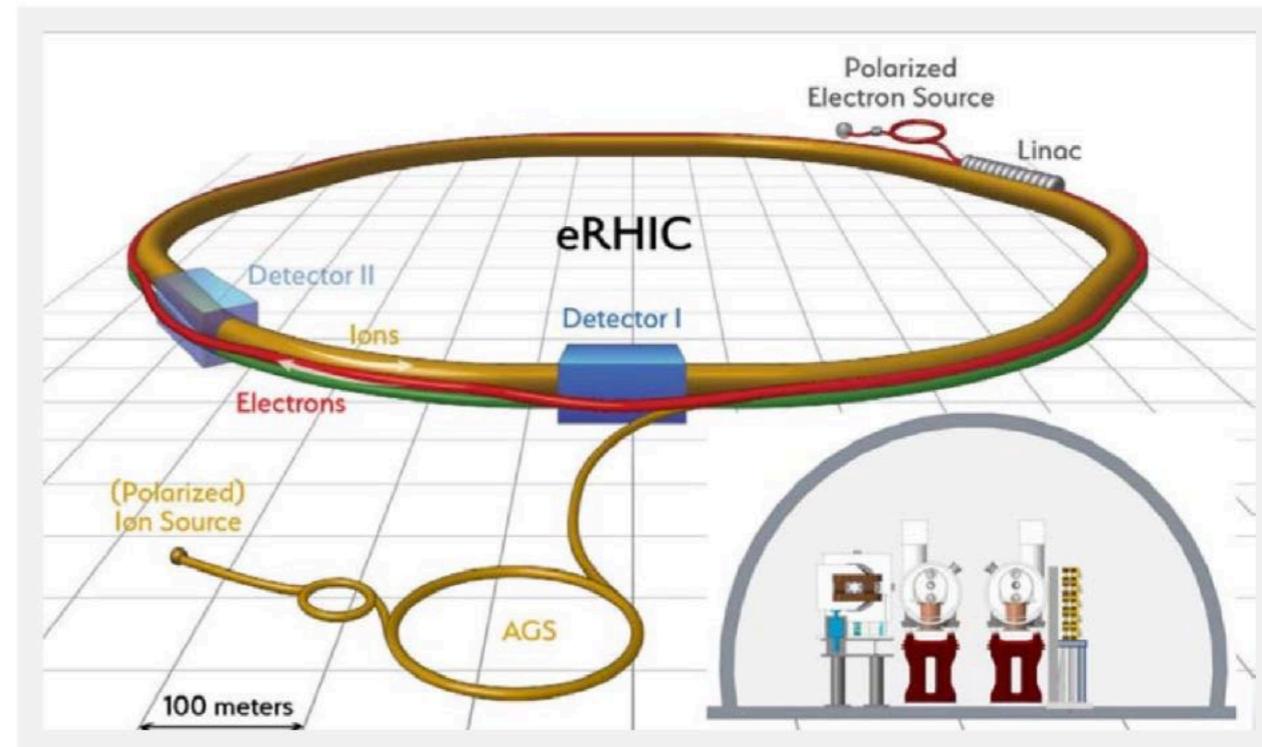

- re-use existing CEBAF 12 GeV electron beam,

U.S.-based EIC - Two Facility Concepts

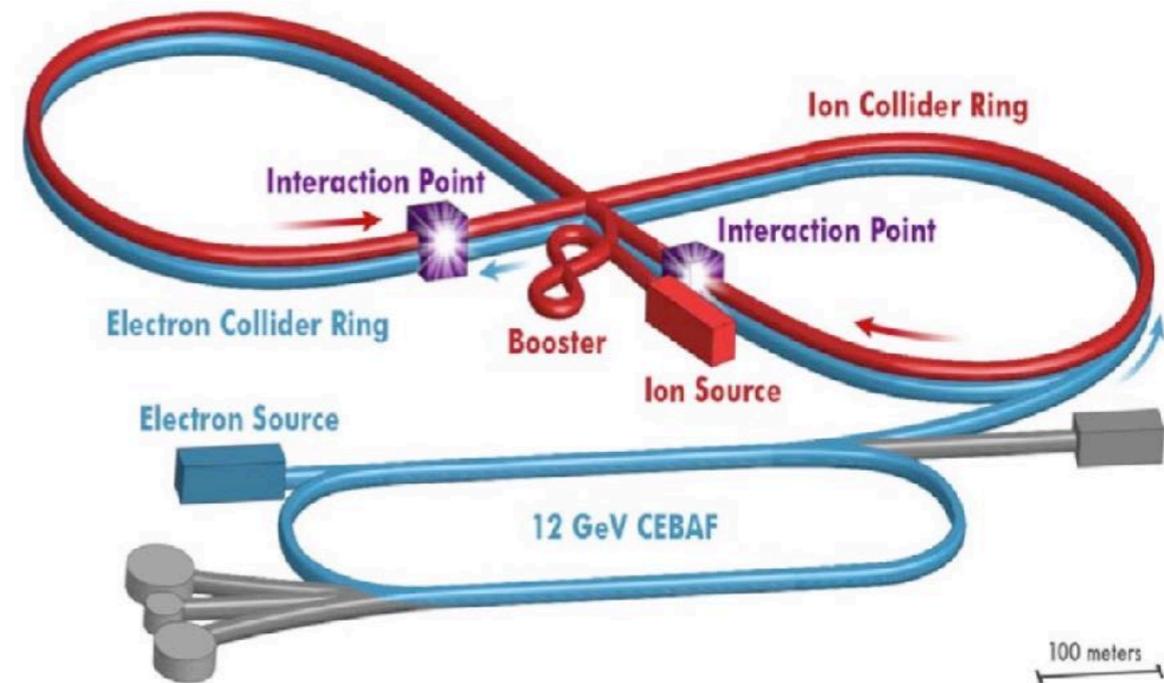

eRHIC (as presented in the W.P.):

- re-use RHIC hadron beam,
- new electron storage ring,
- 5 - 18 GeV e energy,
- Heavy Ions up to 100 GeV/u
- \sqrt{s} up to 93 GeV
- $L \sim 0.4 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}/\text{A}$ base design,
 $1.0 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}/\text{A}$ w. strong cooling

JLEIC (as presented in W.P.):

- re-use CEBAF 12 GeV electron beam facility,
- new hadron injector,
- new figure-8 collider configuration,
- 3-10 GeV electron energy,
- 12-40 GeV/u Heavy Ion energy, upgradable (ion arc dipole)
- $L \sim 10^{34} \text{ cm}^{-2}\text{s}^{-1}/\text{A}$

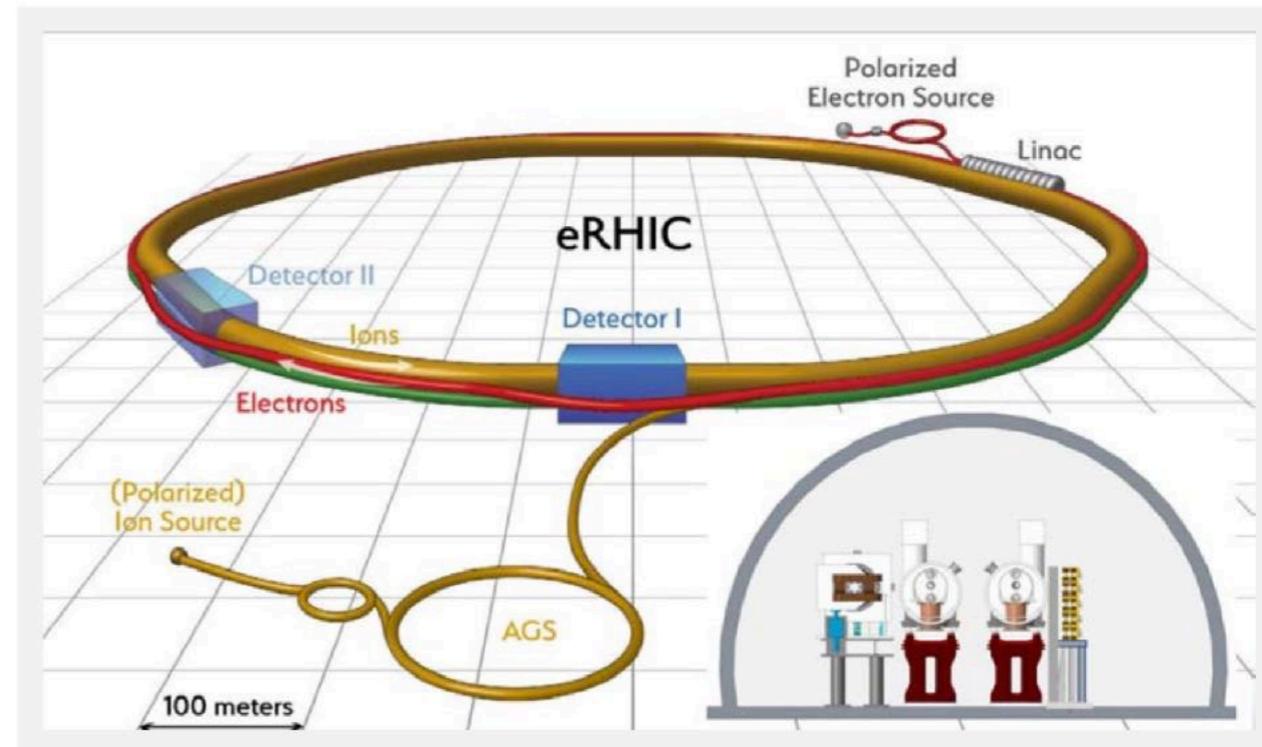

Science cases by themselves!

- *Where does the saturation of gluon densities set in?*
- *How does the nuclear environment affect the distribution of quarks and gluons and their interactions in nuclei?*

U.S. EIC Science Case

Eur. Phys. J. A52 (2016) no.9, 268 - 644 citations

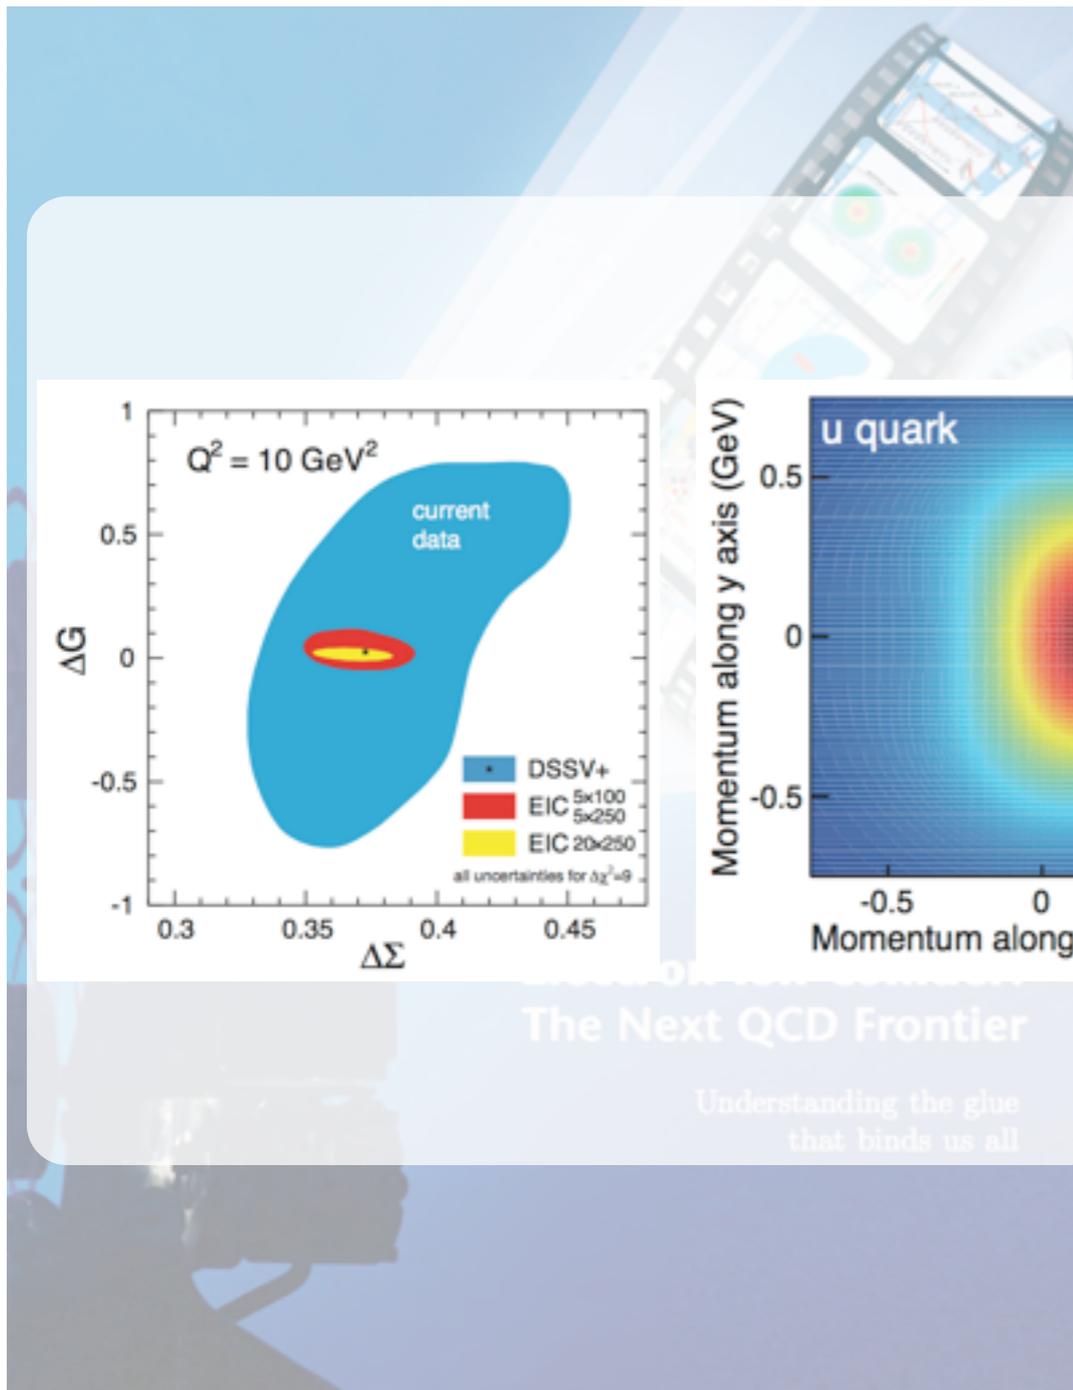

See also Rept.Prog.Phys. 82 (2019) 024301

Organized around four themes:

- *Proton spin,
quark and gluon helicity distributions,
orbital motion*
- *Imaging of nucleons and nuclei
TMDs, GPDs, Wigner functions*
- *Saturation
Non-linear evolution,
Color-glass condensate,*
- *Hadronization and fragmentation,
in-medium propagation,attenuation*

Identified measurements and impact.

U.S.-based EIC - Core Science

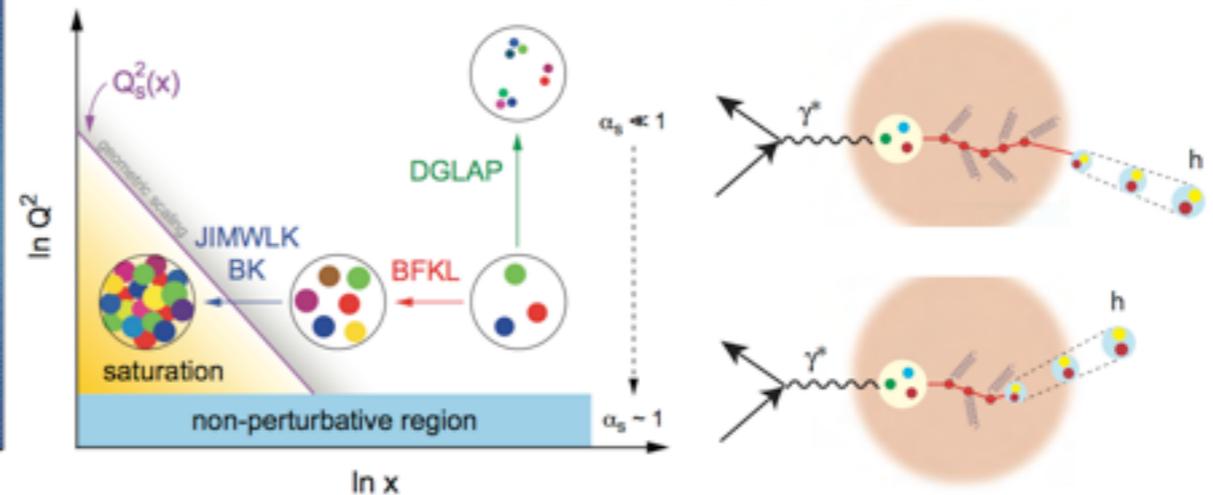

coherent contributions from many nucleons effectively amplify the gluon density being probed.

The EIC was designated in the 2007 Nuclear Physics Long Range Plan as "embodying the vision for reaching the next QCD frontier" [1]. It would extend the QCD sci-

ence programs in the U.S. established at both the CEBAF accelerator at JLab and RHIC at BNL in dramatic and fundamentally important ways. The most intellectually pressing questions that an EIC will address that relate to our detailed and fundamental understanding of QCD in this frontier environment are:

- How are the sea quarks and gluons, and their spins, distributed in space and momentum inside the nucleon? How are these quark and gluon distributions correlated with overall nucleon properties, such as spin direction? What is the role of the orbital motion of sea quarks and gluons in building the nucleon spin?
- Where does the saturation of gluon densities set in? Is there a simple boundary

correlations of sea quark and gluon distributions with the nucleon spin;

- Heavy ion beams are needed to provide precocious access to the regime of saturated gluon densities and offer a precise dial in the study of propagation-length for color charges in nuclear matter.

The EIC would be distinguished from all past, current, and contemplated facilities around the world by being at the intensity frontier with a versatile range of kinematics and beam polarizations, as well as beam species, allowing the above questions to be tackled at one facility. In particular, the EIC design exceeds the capabilities of HERA, the only electron-proton collider

to date, by adding a) polarized proton and light-ion beams; b) a wide variety of heavy-ion beams; c) two to three orders of magnitude increase in luminosity to facilitate tomographic imaging; and d) wide energy variability to enhance the sensitivity to gluon distributions. Achieving these challenging technical improvements in a single facility will extend U.S. leadership in accelerator sci-

Nuclear Physics enabled by EIC **accelerator energy, intensity, polarization, and species, experiment capabilities, theory**

U.S.-based EIC - Observables

Key questions:

- How are the sea quarks and gluons, and their spins, distributed in space and momentum inside the nucleus?
- Where does the saturation of gluon densities set in?
- How does the nuclear environment affect the distribution of quarks and gluons and their interactions in nuclei?

Key measurements:

- Inclusive Deep-Inelastic Scattering,
- Semi-inclusive deep-inelastic scattering with one or two of the particles in the final state,
- Exclusive deep-inelastic scattering,
- Diffraction.

coherent contributions from many nucleons effectively amplify the gluon density being probed.

The EIC was designated in the 2007 Nuclear Physics Long Range Plan as "embodying the vision for reaching the next QCD frontier" [1]. It would extend the QCD sci-

ence programs in the U.S. established at both the CEBAF accelerator at JLab and RHIC at BNL in dramatic and fundamentally important ways. The most intellectually pressing questions that an EIC will address that relate to our detailed and fundamental understanding of QCD in this frontier environment are:

• How are the sea quarks and gluons, and their spins, distributed in space and momentum inside the nucleon? How are these quark and gluon distributions correlated with overall nucleon properties, such as spin direction? What is the role of the orbital motion of sea quarks and gluons in building the nucleon spin?

• Where does the saturation of gluon densities set in? Is there a simple boundary between the gluon saturation regime and the perturbative regime? If so, how does the transition depend on the energy scale of the interaction? Does this saturation produce matter of universal properties in the nucleon and all nuclei viewed at nearly the speed of light?

• How does the nuclear environment affect the distribution of quarks and gluons and their interactions in nuclei? How does the transverse spatial distribution of quarks and gluons in nuclei affect the distribution of quarks and gluons in the final state? Answers to these questions are essential for understanding the nature of visible matter. An EIC is the ultimate machine to provide answers to these questions for the following reasons:

- A collider is needed to provide kinematic reach well into the gluon-dominated regime;
- Polarized nucleon beams are needed to determine the correlations of sea quark and gluon distributions with the nucleon spin;
- Heavy ion beams are needed to provide precocious access to the regime of saturated gluon densities and offer a precise dial in the study of propagation-length for color charge in nuclear matter.

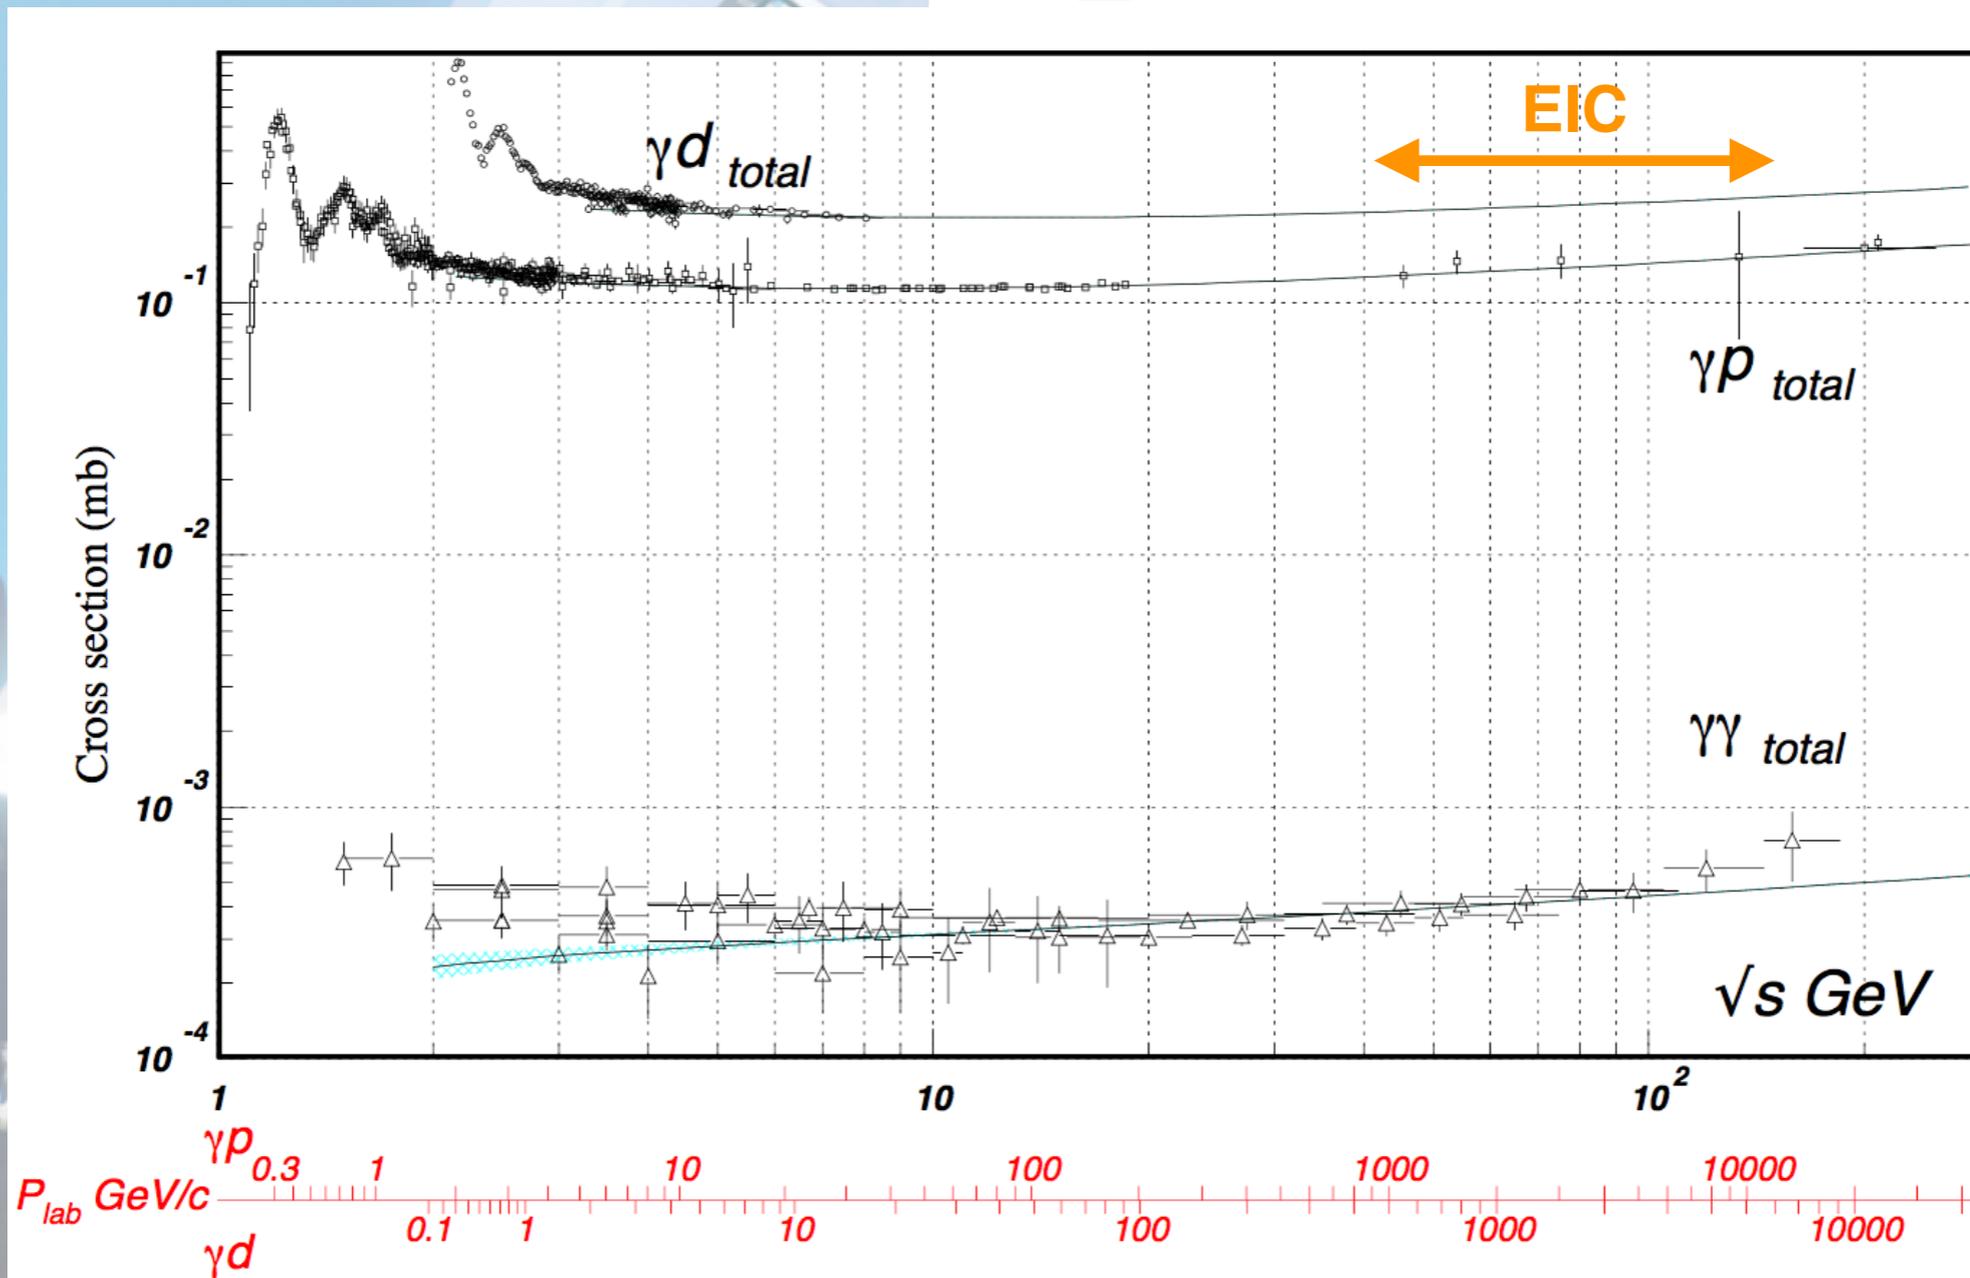

The EIC would be distinguished from all past, current, and contemplated facilities around the world by being at the intensity frontier with a versatile range of kinematics and beam polarizations, as well as beam species, allowing the above questions to be tackled at one facility. EIC - Exclusive Vector Mesons to probe Saturation

*Exclusive vector meson production is key to (all) imaging,
as is deeply virtual Compton scattering*

EIC - SIDIS to study Emergence of Hadrons

Control of $\nu = \frac{Q^2}{2mx}$ and
medium length

Study mass-dependence via
charmed hadrons.

Status of U.S.-based EIC

REACHING FOR THE HORIZON

The Site of the Wright Brothers' First Airplane Flight

The 2015
LONG RANGE PLAN
for NUCLEAR SCIENCE

RECOMMENDATION I

The progress achieved under the guidance of the 2007 Long Range Plan has reinforced U.S. world leadership in nuclear science. The highest priority in this 2015 Plan is to **capitalize on the investments made.**

RECOMMENDATION II

We recommend the timely development and deployment of a U.S.-led **ton-scale neutrinoless double beta decay experiment.**

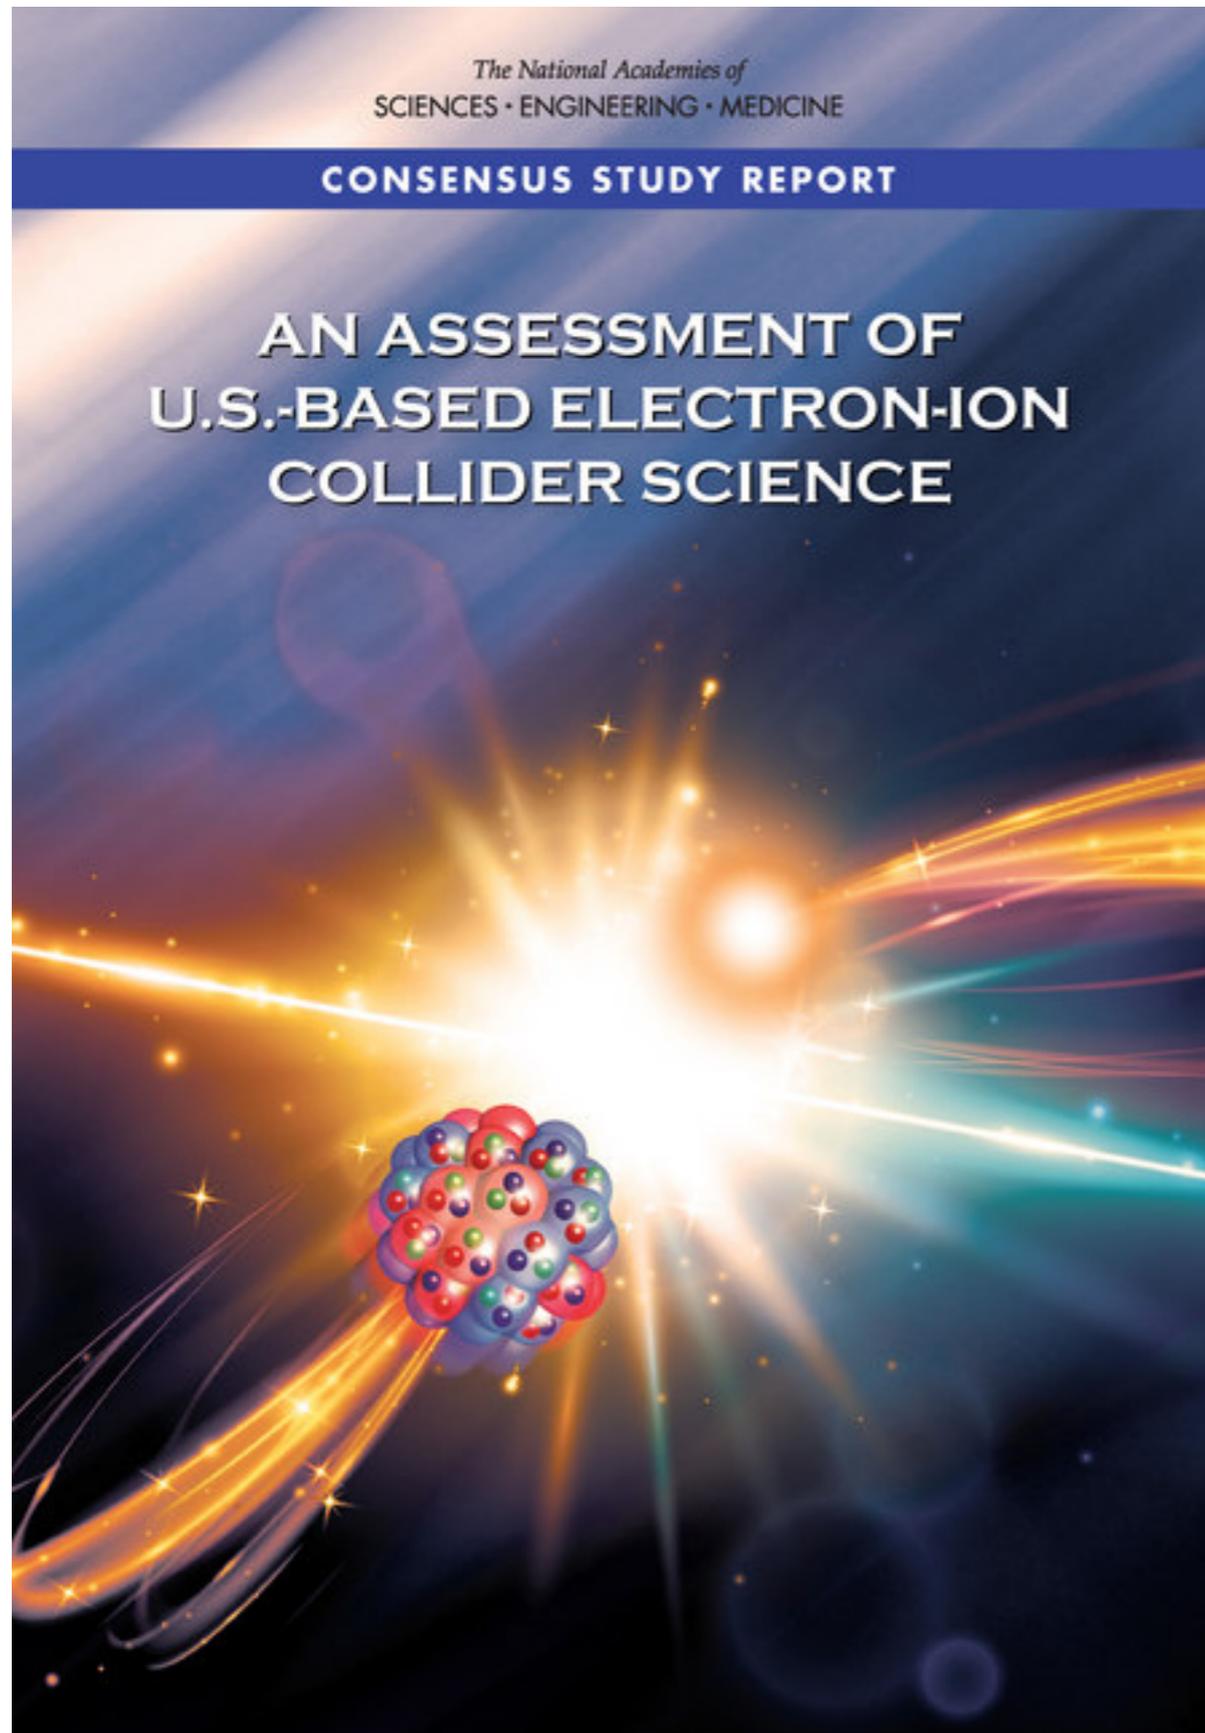

RECOMMENDATION III

We recommend a **high-energy high-luminosity polarized EIC** as the highest priority for new facility construction following the completion of FRIB. [Q3 FY22]

RECOMMENDATION IV

We recommend increasing investment in **small-scale and mid-scale projects and initiatives** that enable **forefront research at universities and laboratories.**

Status of U.S.-based EIC

The committee *unanimously* finds that the science that can be addressed by an EIC is *compelling, fundamental, and timely*.

The *unanimous* conclusion of the Committee is that an EIC, as envisioned in this report, would be a *unique facility in the world that would boost the U.S. STEM workforce and help maintain U.S. scientific leadership in nuclear physics*.

The project is strongly supported by the nuclear physics community.

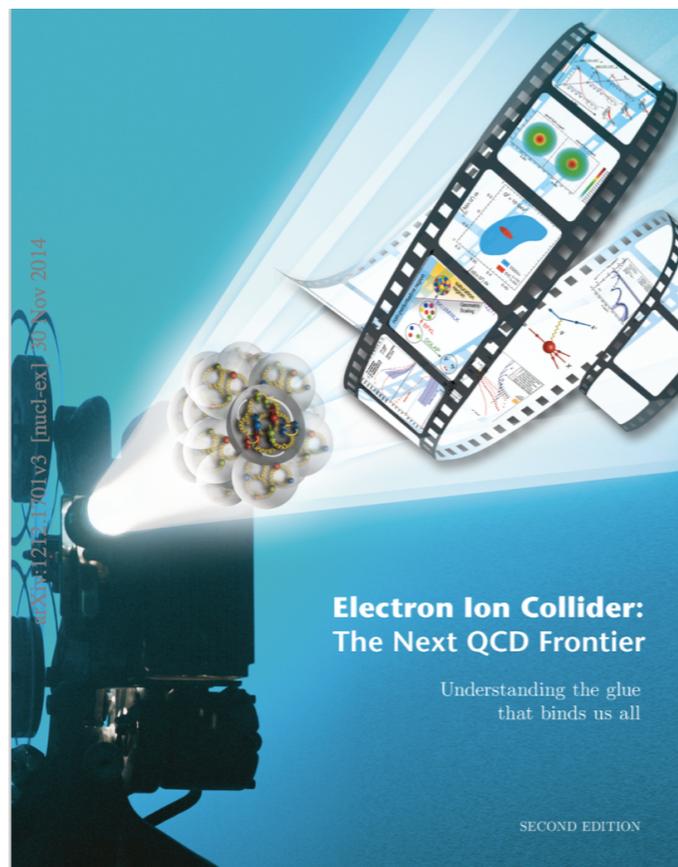

The technological benefits of meeting the accelerator challenges are enormous, both for basic science and for applied areas that use accelerators, including material science and medicine.

U.S.-based EIC - Closing Comments

Four central nuclear physics themes:

- nucleon spin,
- imaging in nucleon and nuclei,
- gluon-dense matter / saturation,
- hadronization and fragmentation

U.S.-based Electron-Ion Collider is strongly endorsed in the 2015 Long Range Plan for Nuclear Physics,

2018 NAS Science Assessment:

“EIC is compelling, fundamental, and timely”

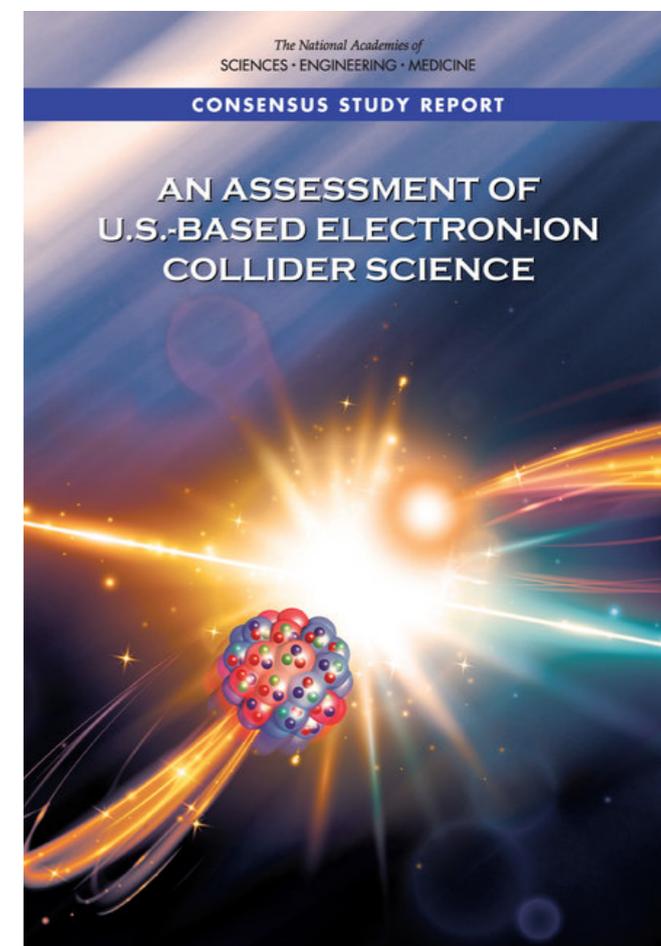

Science case: theory, experiment, *and* accelerator,

U.S. Department of Energy and both candidate host-laboratories are working together towards realizing the *project*,

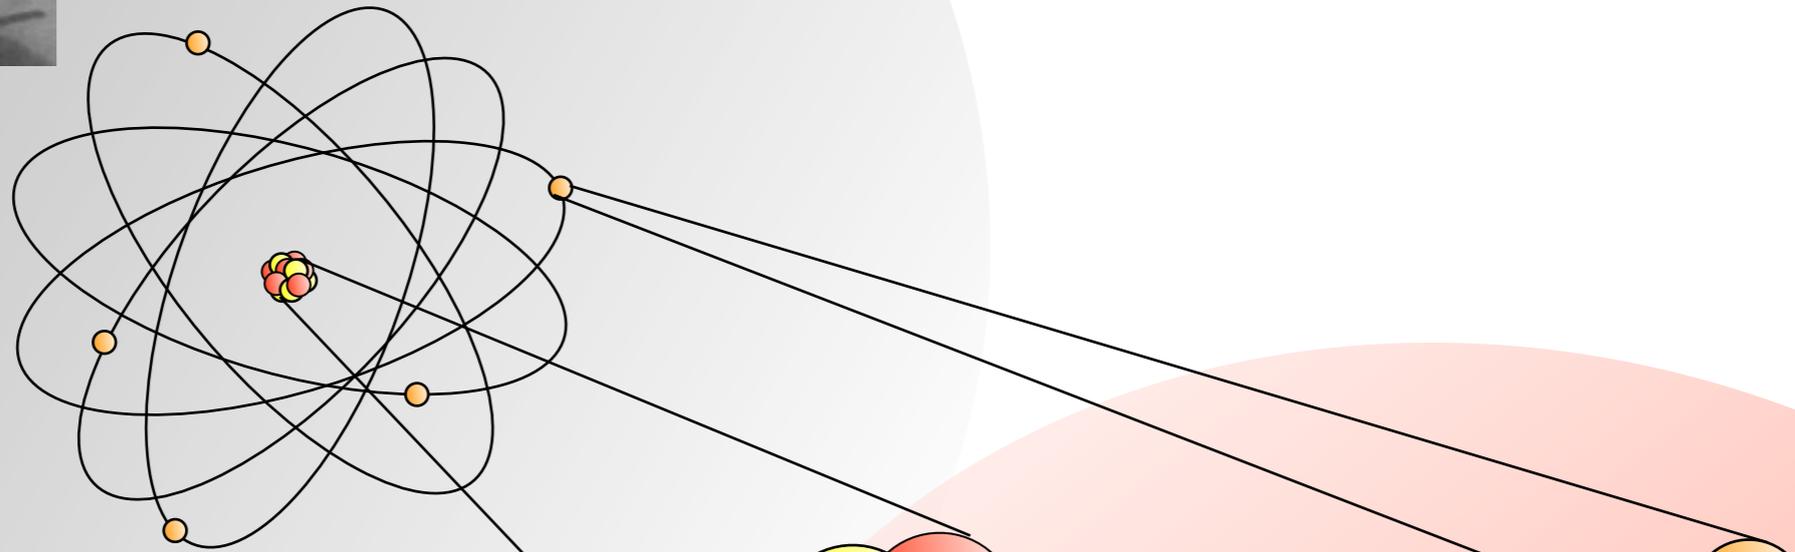

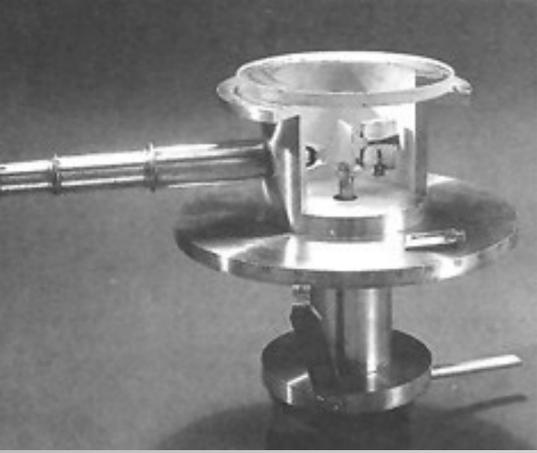

Cost review complete, site selection ongoing,

NP budget has an overall positive (recent) past and outlook,

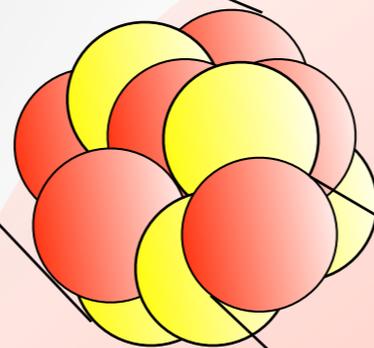

The EIC User Group, eicug.org, welcomes new collaborators; About to embark on a 12-18 month physics and detector conceptual development study.
